TCE	trichloroethene
VOCS	volatile organic compounds
WARP	Well Abandonment and Replacement Program

1.0 INTRODUCTION

The purpose of this Data Summary Report is to document the pre-remedial investigation of Individual Hazardous Substance Sites (IHSSs) 170 and 174A and 174B, also known as the Property Utilization, Storage, and Disposal Storage Yard (PU&D Yard), at the Rocky Flats Environmental Technology Site (RFETS). The purpose of the pre-remedial investigation was to identify if a source of volatile organic compounds (VOCs) in subsurface soil was present in the PU&D Yard that could be impacting groundwater requiring remedial action (RMRS, 1997). The objective of the investigation was to evaluate subsurface soil for VOCs by further investigating the soil gas survey anomalies, two areas of surface staining in the east central portion of IHSS 170, and two attempted well point locations approximately 570 and 680 feet east of IHSS 170 where anomalous organic vapor readings were observed during Well Abandonment and Replacement Program (WARP) FY97 field work. This Data Summary Report summarizes the field activities and analytical results from the activities to locate potential residual VOC contamination equal to or greater than the Rocky Flats Cleanup Agreement (RFCA) Tier I subsurface soil action levels (DOE, 1996). On the basis of the analytical results from this pre-remedial investigation, a VOC contaminant source equal to or above the RFCA Tier I subsurface soil action levels was not identified and the PU&D Yard (IHSSs 170, 174A, and 174B) will not require remediation. This investigation was conducted by Rocky Mountain Remediation Services (RMRS) Environmental Restoration Projects Group on behalf of Kaiser-Hill Company, Inc. (K-H) for the U.S. Department of Energy/Rocky Flats Field Office (DOE/RFFO).

1.1 Background

The PU&D Yard IHSSs are located in the northwest buffer zone and were former storage areas for empty drums, cargo boxes, excess materials, and dumpsters from 1974 until 1994 (Figure 1 - 1). Some drums may have contained unknown residual quantities and types of chlorinated hydrocarbons and chemicals. Two areas within IHSS 170 were specified for the storage of hazardous materials. Specifically, empty drums were stored at IHSS 174A and IHSS 174B was designated for a dumpster. The dumpster contained stainless steel metal chips and lathe turnings coated with freon-based or oil-based lathe coolant. Potential VOC contamination was suspected as a result of the potential of leaking drums containing residual chlorinated hydrocarbons or metal turnings coated with residual chlorinated hydrocarbons at the surface, or as surface spills.

Previous information on IHSSs 170, 174A, and 174B (formerly part of Operable Unit 10 [OU 10]) is documented in an internal letter (Rockwell, 1987), the Closure Plan for the Container Storage Area (Rockwell, 1988), the OU 10 Phase I Resource Conservation and Recovery Act (RCRA) Facility Investigation/Remedial Investigation (RFURI) Work Plan (DOE 1992a), Draft Technical Memorandum No. 1 - Data Summary for OU 10 (EG&G, 1995a), the Final Historical Release Report (DOE, 1992b) and the Hydrogeologic and Geologic Characterization Reports for RFETS (EG&G, 1995b and 1995c).

Specifically, the scope of this investigation was based on the soil gas survey performed per the Phase I RFI/RI which consisted of 235 soil gas sample locations (EG&G, 1995a). Figure 1-1 shows the soil gas survey locations and anomalies which indicated possible subsurface contamination in three investigative areas, (1) the east-southeast side of IHSS 170, (2) the northeast corner of IHSS 170 and IHSS 174A, and (3) the surface stain area in IHSS 174B. The primary volatile organic compounds (VOCs) detected in soil gas were: acetone, benzene, trichloroethene (TCE), tetrachloroethene (PCE), and 1,1,1-trichloroethane (1,1,1-TCA).

The Phase I RFI/RI Work Plan (DOE, 1992a) indicated the presence of chlorinated solvents (PCE at 94 μg/Kg and 1, 1, 1 -TCA at 160 μg/Kg) in near-surface soil in two of the 14 one foot deep soil samples from IHSS 174A (Figure 1-1). The approximate area where these two samples were collected were investigated as part of this investigation. In addition, a total of 71 surface soil locations

(Figure 1-1) were sampled in the PU&D Yard IHSSs (EG&G, 1995a). Thirty-seven soil samples from IHSS 170, twenty-six soil samples from IHSS 174A, and eight soil samples from IHSS 174B were analyzed for total metals, semi-volatile organic compounds, pesticides, and polychlorinated biphenyl's (PCBs). The PCB aroclor- 1254 was observed in four samples from IHSS 174A (EG&G, 1995a) at concentrations greater than the RFCA Tier II surface soil action level but less than the RFCA Tier I surface soil action level (DOE, 1996). Beryllium was observed in two samples from IHSS 174A (EG&G, 1995a) at concentrations greater than the RFCA Tier II surface soil action level but less than the RFCA Tier I surface soil action level (DOE, 1996). Vanadium was observed in one sample from IHSS 174A at a concentration of 43,400 mg/Kg (EG&G, 1995a) which is greater than the RFCA Tier I surface soil action level for industrial use but less than the RFCA Tier I surface soil action level for open space use (DOE, 1996).

High Purity Geranium and Sodium Iodide surveys of IHSSs 170, 174A, and 174B were also performed as part of the RFI/RI (EG&G, 1995a) with no anomalous results observed. However, according to an internal letter (Rockwell, 1987), a small spill of approximately 100 grams of green powder was reported from a drum in December 1987. The powder contained approximately 60 percent aluminum oxide, 32.5 percent chromium oxide, 3,000 pCi/g plutonium, 1,000 pCi/g americium, and 100 pCi/g uranium-235. Approximately 95 percent of the spilled powder was contained in the sample.

1.2 Hydrogeologic and Contaminant Setting

The PU&D Yard is located on an eastward sloping pediment surface where 30 to 40 feet of unconsolidated surficial materials of the Rocky Flats Alluvium overlie weathered claystone bedrock of the Laramie Formation (EG&G, 1995b). Depth to groundwater is approximately five to 20 feet with a hydraulic gradient of 0.01 ft/ft towards the east (EG&G, 1995c). Concentrations of 1,1-Dichloroethene, PCE, and TCE greater than RFCA Tier II groundwater action levels (DOE, 1996) are observed in groundwater monitoring well 70393, upgradient of IHSS 114, the Present Landfill, and in groundwater seep monitoring location 61495, above North Walnut Creek (Figure 1-1).

2.0 FIELD ACTIVITIES

This section describes the sampling and data quality results collected per the SAP for the preremedial investigation of IHSSs 170, 174A, and 174B (RMRS, 1997). Data requirements to support this project were developed using criteria established in *Guidance for the Data Quality Objective Process,* EPA QA/G-4 (EPA, 1994). The data gaps, study boundaries, and decisions are described below.

The primary data gap was the lack of subsurface VOC data for soil and groundwater. Twenty soil borings were advanced as shown on Figure 2-1 and thirty-eight subsurface soil samples were collected for VOC analyses to evaluate subsurface soil for VOC contamination equal to or greater than the RFCA Tier I subsurface soil action levels (DOE, 1996). Six groundwater samples were collected to characterize VOC contamination to assist with source delineation.

Four groundwater monitoring wells were installed to the north, east, west, and south of IHSS 170 as shown on Figure 1-1, as part of the Groundwater Monitoring Program FY97 WARP and agreed to by the regulators. Hollow-stem auger drilling methodology was utilized and 20 composite soil samples from drummed soil cuttings were collected for TCLP-metals analysis for RCRA waste characterization. Soil analytical results for total VOCs were also used for RCRA waste characterization.

2.1 Data Quality Objectives

The data quality objectives for this investigation are summarized in Tables 2-1 and 2-2. Deviations from the SAP (RMRS, 1997) are a minimum of one VOC sample collected per boring instead of three per boring as planned due to shallow groundwater conditions encountered and one additional soil boring BHI8997 was located southwest of BH17497 due to detectable concentrations of PCE

observed in subsurface soil. In addition, soil analyses were performed by EPA SW846/8260 instead of EPA SW846/8240. One soil boring, BH18897, was not abandoned and was subsequently utilized by the WARP to install monitoring well 01797. Investigative, quality control, and quality assurance samples were collected as summarized in Table 2-2. In addition, a summary of data usability on validated data is provided in Appendix E.

2.2 Sampling

Twenty soil borings were drilled during this investigation as shown on Figure 2-1 and samples were collected as described below. Borings were drilled one to two feet into groundwater or to a sufficient depth to confirm or collect groundwater samples. Thirteen soil borings were located over VOC soil gas survey anomalies delineated by the 1994 soil gas survey (Figure 1-1 and 2-1). Two soil borings were located over two additional areas of surficial oil staining (Figure 1-1 and 2-1), two soil borings were located over the two surface soil locations with detectable VOCs in IHSS 174A, and one soil boring was located 15 feet southwest of BH17497 where PCE was observed in subsurface soil. Two soil borings were located over two attempted well point locations approximately 570 and 680 feet east of IHSS 170 where anomalous organic vapor readings were observed by the WARP on August 28, 1997 (Figure 2-1). Soil boring locations were radiologically surveyed using the Field Instrument for Detection of Low Energy Radiation (FIDLER) per FO. 16, "Field Radiological Measurements".

Subsurface soil samples were collected at five foot intervals, or where visible staining or other indications of VOC contamination were present. Two-foot core runs using a split-spoon sampler were collected with a hollow-stem auger drill rig, logged in the field, and field screened for VOCs. A Photoionization Detector (PID) was used in the field to screen the collected core to assist in identifying the intervals where VOCs may be present. Soil core was visually logged per the SAP (RMRS, 1997) by the field geologist and boring logs are presented in Appendix A. Radiological screening samples, when required, were composited from the 0.5 foot interval above the VOC sample. Three surface soil samples were collected adjacent to BH17997 (Figure 2- 1) where the highest FIDLER survey measurements were recorded.

Groundwater was encountered between 5 and 20 feet below ground surface in the investigation areas (Appendix A). Groundwater samples were collected either through the hollow-stem auger or from the open borehole with a bailer from each investigative area with sufficient groundwater from the western, upgradient, boring (Figure 2-1).

2.3 Analytical Results

Analytical results for VOCs in soil and the RFCA Tier I subsurface soil action levels for VOCs identified during this investigation are summarized in Table 2-3. Analytical results for VOCs in groundwater and the Tier II groundwater action levels for VOCs identified during this investigation are summarized in Table 2-4. Form 1 VOC analytical results are presented in Appendix B.

Analytes detected in the subsurface soil are methylene chloride, PCE, and napthalene. Concentrations of methylene chloride in subsurface soil that exceed ten times the maximum amount detected in quality control laboratory blanks, trip blanks, and rinse blanks and should be considered a positive result (EPA, 1989) (Table 2-3 and Appendix B and E). However, the maximum concentration of methylene chloride of 3,000 µg/Kg does not exceed the RFCA Tier I subsurface soil action level of 5.77 mg/Kg (Table 2-3). One sample from BH18997 had an estimated concentration of TCE of 360 µg/Kg, which is below the RFCA Tier I subsurface soil action level (Table 2-3). Napthalene was observed in one sample from BH17897 with an estimated concentration of 390 µg/Kg, which is well below the RFCA Tier I subsurface soil action level of 1,460 µg /Kg (Table 2-3). Concentrations of PCE were observed in three subsurface soil samples from boring BH17497 with a maximum of 5.7 mg/Kg (Table 2-3). This concentration of PCE is below the RFCA Tier I subsurface soil action level of 11.5 mg/Kg (Table 2-4). No other VOCs were observed in surrounding borings (Table 2-3 and Figure 2-1).

9

Table 2-1 **Data Quality Summary**

Data Quality Objective	Activity	Results
Locate concentrations of VOCs in soil equal to or greater than the Tier I subsurface soil action levels listed in Table 2-3. Document concentrations of radionuclides in surface soil.	20 soil borings were drilled from 8 to 22 feet or one to two feet into groundwater. A minimum of one soil sample per boring was analyzed for VOCs. Two QC samples (one duplicate and one rinsate) were collected per 20 real samples and one trip blank per cooler. Analyses were by USEPA VOA by SW846/8260. Three surface soil samples and one duplicate were collected based on the three highest FIDLER survey results and analyzed for radioisotopes by HPGe.	PCE was detected in 3 of 38 samples with a maximum concentration of 5,700 µg/Kg. TCE was detected in one of 38 samples with an estimate concentration of 390 µg/Kg. Napthalene was deteced in one of 38 samples with an estimated concentration of 390 µg/Kg. Methylene chloride was detected in 28 of 38 samples with a maximum concentration of 3,000 µg/Kg.
Characterize groundwater for the presence of VOCs. Assist with delineation of residual VOC source area.	20 soil borings were drilled to a sufficient depth to collect ground water samples with six soil borings having a groundwater sample collected and analyzed for VOCs. Two QC samples (one duplicate and one rinsate) was collecter per 20 real groundwater samples and one trip blank per cooler. Analyses were by SW846/8260.	1,1,1-TCA was detected of 3 of 6 samples with a maximum concentration of 14 µg/L. PCE was detectd in 5 of 6 samples with a maximum concentration of 1,700 µg/L, which is less than 10 times the level observed in the method blank and therefore is eliminated from the sample results. Acetone was observed on 1 of 6 samples with a concentration of 4 µg/L, which is less than the concentration observed in the method blank and therefore is eliminated from the sample results. Trichlorotrifluoroethane was observed in 3 of 6 samples with a maximum concentration of 40 µg/L. TCE and 1,1-DCE were observed in 1 of 6 samples with concentrations of 2.7 and 5.5 µg/L, respectively.
Characterize investigative derived materials (IDM) – soil cuttings from hollow-stem auger drilling for RCRA waste disposition.	One composite sample per borehole from 20 soil borings were collected and analyzed for TCLP-metals. Two QC samples (one duplicate and one rinsate) were collected per 20 real samples. Results of VOC soil samples as described above were utilized for this objective.	VOC results as summarized above. TCLP-metals – see Appendix C.

J = Estimated concentration of anlyte detected below method practical quantitation limit.
B = Analyte appears in method blank.
1,1-DCE = 1,1-Dichloroethene

Table 2-2 **Quality Control Sample Summary**

Type of Samples	Number of REAL	Number of DUPLICATE	Number of TRIP BLANK	Number of RINSE BLANK
BH	38	2	10	2
BP	20	1	NA	1
GW	6	1	2	1
SS	3	1	NA	NA

Note: BH = soil samples, BP = IDM soil samples, GW = groundwater samples, and SS = surface soil samples.

10

Analytes detected in groundwater include acetone, methylene chloride, 1,1-DCE, 1,1,1-TCA, PCE, TCE, and trichlorotrifluoroethane (Table 2-4). One detectable concentration of acetone was observed which is less than the concentration observed in the laboratory method blank, therefore, acetone is eliminated from the data set (EPA, 1989).. Concentrations of methylene chloride in groundwater are less than ten times the maximum amount detected in quality control laboratory method blanks (16 µg/L), trip blanks, and rinse blanks and will be eliminated from the data summary (EPA, 1989) (Table 2-4 and Appendix B and E). The VOCs TCE and 1, 1 -DCE were observed in one sample location BH18897, downgradient of IHSS 170, at concentrations of 2.7J µg /L and 5.5 µg /L, respectively. Both concentrations are below the RFCA Tier II groundwater action level. The VOC 1,1,1-TCA was observed in two sample locations, BH17997 and BH18197, at concentrations well below the RFCA Tier II groundwater action level (Table 2-4). Concentrations of PCE were observed in two groundwater sample locations; one from boring BH17497 with 1.7 mg/L and the second from boring BH18197 with 15 µg/L (Table 2-4). These concentrations of PCE are above the RFCA Tier II action level of 5 µg/L (Table 2-4). Trichlorotrifluoroethane (Freon 113) was observed in three sample locations BH17897 and BH17997 at concentrations of 3.5 J µg/L and 40 µg/L, respectively and at sample location BH18897 with 4.6 J µg/L (Table 2-4). Trichlorotrifluoroethane does not have an action level under RFCA or a Programmatic Preliminary Remediation Guideline (PPRG), and is not considered a highly toxic compound.

TCLP-metals analytical results for RCRA waste characterization are presented in Appendix C and discussed in Section 2.5, below.

Surface soil analytical results for radiological isotopes are presented in Appendix D. Concentrations of radiological isotopes are below background and the RFCA Tier I and Tier II surface soil action levels (DOE, 1996).

A summary of data usability on validated data is provided in Appendix E.

2.4 Abandonment of Borehole Locations

After completion of sampling at each location, boreholes were abandoned, except location BH18897 which was utilized by the WARP for construction of monitoring well 01797. Each boring location was identified with the unique location number assigned on a survey marker. Each boring location was surveyed for northing and easting coordinates, and elevation using a Global Positioning Satellite receiver. Survey coordinates are noted on the boring logs in Appendix A.

2.5 Waste Disposition

Soil cuttings generated by hollow-stem auger drilling were monitored, containerized, and managed per plant procedures. Drums were characterized as Investigative Derived Material (IDM) - soil, labeled as hazardous waste, and temporarily stored in RCRA storage unit 18.03 pending receipt of analytical results. Analytical results for TCLP-metals are presented in Appendix C and VOA analytical results are summarized in Section 2.3. On the basis of the VOC analyses none of the IDM-soil exhibits VOC levels equal to or above the RFCA Tier I subsurface soil action levels. In addition, none of the VOC results could exceed a VOC toxicity characteristic as defined in 6 CCR 1007-3, Part 261.24. Therefore, the soil is not hazardous for VOCs per 6 CCR 1007-3, Part 261.24. On the basis of the TCLP-metals analytical results, none of the IDM soil exhibits hazardous metal concentrations per 6 CCR 1007-3, Part 261.24. Therefore, IDM-soil generated during this investigation will be placed back onto the surface of IHSSs 170, 174A, and 174B.

11

J Estimated concentration of analyte detected below method practical quantitation limit.
B Analyte appears in method blank.
Nb^ = Not available, there is no action level per RFCA or PPRG for this compound.

12

3.0 CONCLUSIONS AND RECOMMENDATIONS

Detectable concentrations of PCE in soil and groundwater from location BH17497 are most likely a result of previous drum storage and handling operations in IHSS 174A. The proximity of adjacent soil borings (Figure 2-1) to BH17497 with no detectable PCE indicates a small area of residual diffuse soil contamination that is less than the RFCA Tier I subsurface soil action level for PCE. However, the residual PCE soil contamination appears to be contributing to groundwater contamination greater than the RFCA Tier I groundwater action level. Concentrations of methylene chloride observed in soil appear to be a laboratory artifact even though the EPA guidance for comparison of concentrations detected in blanks with concentrations detected in samples indicates the results are positive. The concentrations of methylene chloride observed are below the RFCA Tier I subsurface soil action level and methylene chloride was not observed in the previous soil gas survey. The concentrations of TCE and napthalene are well below their respective RFCA Tier I subsurface soil action levels. No other VOCs were observed in subsurface soil.

Detectable concentrations of 1,1,1-TCA and PCE were observed in groundwater from boring BH18197. The concentration of PCE is greater than the Tier II groundwater action level and is probably a result of previous storage and handling operations in the southeast corner of IHSS 170. Residual subsurface soil contamination is probably located to the west towards BH18097, where no VOCs were observed in soil or groundwater. BH18097 is located approximately 120-feet to the west of BH18197 (Figure 2- 1).

Trichlorotrifluoroethane (Freon 113) was observed in two groundwater sample locations, BH17897 and BH17997. The source of the trichlorotrifluoroethane is probably residual subsurface soil contamination adjacent to and west of BH17997 in IHSS 174B, where the dumpster containing stainless steel metal chips and lathe turnings coated with freon-based coolants was located (Figure 2-1). A medium method detection level was used for subsurface soil which may have prevented detections of trichlorotrifluoroethane in subsurface soil. Location BH18897 also had estimated concentrations of TCE and trichlorotrifluoroethane and concentrations of 1,1-DCE and 1,1,1-TCA. The VOCs 1,1-DCE and TCE are breakdown products of PCE and IHSS 170 could have been the source of the contaminants. However, BH18897 is located downgradient of IHSS 170 and there could be other residual subsurface sources in the existing PU&D yard, which has been used as a materials storage area since 1972.

On the basis of the analytical results from this pre-remedial investigation, a VOC contaminant source equal to or above the RFCA Tier I subsurface soil action levels was not identified and the area of IHSSs 170, 174A, and 174B will not require remediation. However, residual diffuse VOC contamination less than the Tier I subsurface soil action levels is present in IHSS 174A, which impacts groundwater in the investigative area. On the basis of the previous radiological evaluations and the limited radiological analyses performed as part of this investigation there appears to be no surficial radiological contamination equal to or greater than the RFCA Tier I surface soil action levels for radionuclides requiring remediation. However, the area should be revegetated as a maintenance action to improve the proposed future use as open space due to the surficial debris and undesirable noxious weeds present at the site. According to

RFETS ecologists, a recommended revegetation plan would consist of scarifying the upper 8-inches of topsoil, placing 3-inches of imported weed-free topsoil over the area, and then reseeding using an RFETS approved seed mixture, a no-till drill, and hydromulch.

		2.0/2.0						16		16.0 – 17.0 same as 11.8-12.0
										4 8 12 16
							SC	17		17.0 – 18.0 clayey sand (SC) w/ trace gravel, light brown (5YR 5/6) moist, f-c sand mdm dense, plastic clay matrix
		2.0/2.0					CL	18		18.0 – 20.0 sandy clay, CL, f-m sand, plastic, stiff to very stiff
										3 4 7 11 increase in sand 19.8'
								19		
								20		

NOTES: General: USCS is modified for this log as follows:
Materials amounts are estimated by % volume instead of % weight.
(1) Badly broken core, accurate footage measurements not possible.
(2) Core breaks cannot be matched, accurate footage measurements not possible.

APPENDIX 4

TCLP REGULATORY LEVELS AND TABLE OF RISK-BASED CONCENTRATIONS

TABLE 6-1

TCLP CONSTITUENTS OF CONCERN MAXIMUM CONTAMINATION LEVELS

CHEMICAL	REGULATORY LEVEL
Arsenic	5.0
Barium	100.0
Benzene	0.5
Cadmium	1.0
Carbon tetrachloride	0.5
Chlordane	0.03
Chlorobenzene	100.0
Chloroform	6.0
Chromium	5.0
o-Cresol	200.0[a]
m-Cresol	200.0[a]
p-Cresol	200.0[a]
Cresol	200.0[a]
2,4-D	10.0
1,4-Dichlorobenzene	7.5
1,2-Dichloroethane	0.5
1,1,-Dichloroethylene	0.7
2,4-Dinotrotoluene	0.13[b]
Endrin	0.02
Heptachlor (and its hydroxide)	0.008
Hexachlorobenzene	0.13[b]
Hexachlorobutadiene	0.5
Hexachloroethane	3.0
Lead	5.0
Lindane	0.4
Mercury	0.2
Methoxychlor	10.0
Methyl ethylketone	200.0
Nitrobenzene	2.0
Pentachlorophenol	100.0
Pyridine	5.0[b]
Selenium	1.0
Silver	5.0
Tetrachloroethylene	0.7
Toxaphene	0.5
Trichloroethylene	0.5
2,4,5-Trichlorophenol	400.0
2,4,6-Trichlorophenol	2.0
2,4,5-TP (Silvex)	1.0
Vinyl chloride	0.2

[a] If o-, m-, and p-Cresol concentrations cannot be differentiated, the total cresol (D026) concentration is used. The regulatory level of total cresol is 200 mg/l.

[b] Quantitation limit is greater than the calculated regulatory level. The quantitation limit therefore becomes the regulatory level.

APPENDIX E

DATA USABILITY

Appendix E

Data Usability

This section provides the results of the data quality assessment that was conducted in accordance with the Evaluation of Data for Usability in Final Reports (RMRS Procedure, RF/RMRS-98-200 [RMRS, 1998]). This assessment ensures that data used in making management decisions for remedial actions is of adequate quality to support the decisions.

As described in the SAP (RMRS, 1997), field decisions were based on "Form-1s" faxed directly from the laboratory to support timely field decisions. Data usability was performed after the data were used for their intended purpose. Analytical laboratories supporting the project have all passed regular laboratory audits by the Kaiser-Hill Analytical Projects Office.

The following data sets were quantitatively evaluated as part of this data quality assessment (e.g., full PARCC parameter evaluation):

- volatile organic compound samples for source delineation and waste characterization;
- TCLP-metals for waste characterization; and
- surface soil samples for radionuclide analysis.

As discussed herein, Data Quality Objectives for the project were achieved. A summary of project DQOs and results for this investigation is presented in Table E-1.

VERIFICATION OF RESULTS

Verification ensures that data produced and used by the project are documented and traceable per quality requirements. Generally, verification consists of reviewing the data to determine whether:

- Chain-of-Custody was intact from initial sampling though transport and final analysis;
- Preservation and hold-times were within tolerance;
- Selected samples underwent analysis at certified labs; and
- Format and content of the data is clearly presented relative to goals of the project.

In addition to the criteria noted above, verification of the data also included additional checks sometimes acknowledged as within the "validation" category, depending on the type of analysis:

- Surrogate recovery;
- MS/MSD recovery;

Table E-1 Sample Types & Data Quality Objectives

Sample Type	Data Quality Objective	Assurance Method	Results
VOCs in Subsurface Soils.	Locate concentrations of VOCs in soil ≥ Tier I Subsurface Soil Action Levels listed in Table 2-2.	15 to 30 soil borings drilled to 20 feet or one to two feet into groundwater. A minimum of three soil samples per boring analyzed for VOCs. Two QC samples (one duplicate and one rinsate collected per 20 investigative samples. Analysis by USEPA VOA by SW846/8240.	Twenty soil borings completed with 38 investigative, two duplicate, ten trip blank, and two rinse blank VOC samples. No VOC concentrations equal to or above the RFCA Tier I Soil Action Levels. VOC results evaluated for waste characterization and the soil/drill cuttings are non-hazardous.
Radionuclides in Surface Soil	Document concentrations of radionuclides in surface soil.	Collect three surface soil samples based on three highest FIDLER survey results and analyze by alpha spectroscopy.	Three investigative and one duplicate soil sample collected. No radionuclide concentrations greater than background and less than RFCA Tier II Soil Action Levels.
VOCs in Groundwater.	Characterize groundwater for the presence of VOCs. Assist with delineation of residual VOC source area.	15 to 30 soil borings drilled to a sufficient depth to collect groundwater samples with a minimum of 30 percent of the soil borings with a groundwater samples collected and analyzed for VOCs. One QC sample (one duplicate and one rinsate) collected per 20 investigative groundwater samples. Analysis by VOC screening.	Six investigative, one duplicate, two trip blanks, and one rinse blank samples from six boreholes for VOC analysis (30 percent of the total number of boreholes) were collected. VOC results evaluated for residual VOC source area. One additional soil boring completed.
Metals in Subsurface Soils.	Characterize investigative derived materials (IDM) – soil cuttings from hollow-stem auger drilling for RCRA waste disposition.	Collect one composite sample per borehole from 15 to 30 soil borings and analyze for TCLP-metals. Results of VOC soil samples as described above, will also be utilized for this objective.	Twenty real and one duplicate composite samples collected for TCLP-metals analysis. Soil/drill cuttings characterized as non-hazardous.

- Calibrations;
- Blanks;
- Sample preparations; and
- Other quality control.

In order to provide an integrated evaluation of the data quality, results of the verification are collectively discussed with validation.

VALIDATION

Validation consists of a technical review of the data, or portion of the data, so that any limitations of the data relative to project goals are identified, and the associated data are qualified accordingly. Data were validated relative to the precision, accuracy, representativeness, completeness, and comparability (PARCC) parameters described in the next section. Validation is also currently performed on a site-wide basis at 25% frequency by K-H Analytical Services Division. Satisfactory validation at this frequency indicates that the subcontracted labs are operating competently relative to industry-wide standards, and more specifically, that sample custody and analytical procedures are implemented under defined quality controls. Site-wide data validation coupled with annual lab audits provides the inference that all analytical and radiochemical results not specifically validated, are represented by the percentage that is validated.

Validation by an independent third party was performed on 29 percent of the VOC data, 100 percent of the VOC groundwater data, and 33 percent of the TCLP-metals data, which meet the requirement of 25 percent validation by an independent third party. The remaining VOC data were verified by an independent third party. Original verification and validation (V&V) packages for the project are managed and filed by the K-H Analytical Services Division, Building 881.

Verification and validation of the project data included use of the following protocols and guidance:

- RMRS Procedure RF/RMRS-98-200, Evaluation of Data for Usability in Final Reports;
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, 1994, EPA 540/R-94/013;
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, 1994, EPA 540/R-94/012;
- Guidance for Data Quality Assessment, Practical Methods for Data Analysis, 1996, EPA QA/G-9;
- *Kaiser-Hill Team Quality Assurance Program*, 1997, Rev. 5; and
- RMRS *Quality Assurance Program Description (QAPD)*, RMRS-QAPD-001, Rev. 2, (RMRS, 1998).

176

PARCC PARAMETERS

Precision

Precision is a measure of the reproducibility of results. Precision is evaluated by comparing results from field duplicate and/or replicate (duplicate/replicate) samples with results from associated real samples. Precision will be evaluated quantitatively by using two functions, relative percent difference (RPD), and duplicate error ratio (DER), where the latter function is used to account for the stochastic nature of error of radioactivity. The DER is a test for bias between a field duplicate or replicate and the associated real sample for radionuclides.

Equations E1 and E2 present the RPD and DER equations

$$RPD = \frac{|C_1 - C_2|}{|(C_1+C_2)/2|} * 100 \qquad \text{(Eq. E1)}$$

where:

C_1=first sample
C_2=duplicate sample

$$DER = \frac{|C_1 - C_2|}{\sqrt{(TPU^2_{C1} + TPU^2_{C2})}} \qquad \text{(Eq E2)}$$

where:

TPU = total propagated uncertainty

Duplicate Sample Collection Methodology

Field duplicate samples collected in support of the investigation were collected as unique samples. The duplicate alpha spectroscopy sample was collected adjacent to the real surface soil sample collected at a FIDLER measurement location. VOC quality assurance (QA) samples are identified as duplicates because the real and QA samples were collected from adjacent depth intervals (i.e. not split).

The purpose of the field duplicates are to evaluate the precision of the field sampling process. Duplicate samples exceeding the DER critical value of 1.96 are interpreted as different at the 5% level of significance, are qualified as "J", and the conclusion is reached that the sample and duplicate differ. Duplicate samples exceeding the RPD critical value of 40%, require; indicating how precision does not comply with DQO specification, an explanation and justification of deficiencies, and a determination if additional sampling is required. At least 85% of all quality control samples are required to comply with the established precision or RPD goals. The following sections describe the results of duplicate sample results for each laboratory analytical program.

Volatile Organic Compound Analysis (EPA 8260A)

Two duplicate subsurface soil samples were collected and provided to the laboratory for analysis of volatile organic compounds. Table E-2 provides the number of samples collected under this program and the results of the RPD for the duplicate assessment. Overall precision compliance for the VOC investigation was 100%.

Table E-2 Duplicate Subsurface Soil Sample Assessments – Volatile Organic Compound Analysis

Analyte	Total Real Samples Collected	Total Duplicates Collected	Number of Duplicates within RPD	Overall Precision Compliance
PCE	38	2	2	100%
TCE	38	2	2	100%
1,1,1-TCA	38	2	2	100%

Volatile Organic Compound Analysis (VOA Screening)

One duplicate groundwater sample was collected and provided to the laboratory for analysis of volatile organic compounds. Table E-3 provides the results of the RPD for the duplicate groundwater assessment. Overall precision compliance for the groundwater sample was 73%. Although the precision compliance for groundwater is less than project completeness goals, precision of the VOC results are acceptable. The apparent imprecision noted is limited to a detection in the real sample and non-detect in the associated duplicate sample.

Table E-3 Duplicate Groundwater Sample Assessment – Volatile Organic Compound Analysis

Analyte	Total Real Samples Collected	Total Duplicates Collected	Number of Duplicates within RPD	RPD
PCE	6	1	1	0
TCE	6	1	1	0
1,1,1-TCA	6	1	0	81%

Radionuclide Analysis (Alpha Spectroscopy)

One duplicate surface soil sample was collected from location SS17097 and provided to the laboratory for alpha spectroscopy analysis. The frequency for duplicate sample collection for alpha spectroscopy analysis was met for this program. As shown in Table E-4 all isotopes met the project's precision compliance goal of 1.96.

Table E-4 Radionuclide Surface Soil Precision Assessment – Alpha Spectroscopy Results

Analyte	Duplicate Sample Result (97A2446-004.006)	2-Sigma Error	Associated Real Sample Result (97A2446-003.005)	2-Sigma Error	DER	Overall Precision Compliance
$^{239/240}$Pu	0.0356	0.0266	0.0392	0.0253	0.1	100%
^{241}Am	0.0295	0.0280	0.0275	0.0221	0.1	100%
$^{233/234}$U	0.8070	0.1080	0.7500	0.1140	0.4	100%
^{235}U	0.0430	0.0270	0.0240	0.0263	0.5	100%
^{238}U	1.0200	0.1210	0.7990	0.1170	1.3	100%

Accuracy

Accuracy is a measure of how closely an analytical result corresponds to the "true" concentration in a sample. Accuracy is evaluated by comparing the required analytical method and detection limit with actual method used. Evaluation of the VOC soil samples were required as summarized in Table E-5. The required detection limit of 740 ug/kg was maintained for all target analytes. Detection limits for VOC screening of groundwater samples were accurate for the intended purpose of the investigation. Detection limits for TCLP-metals are accurate, with no deficiencies noted during data validation and verification.

Table E-5 Comparison of Detection Limits – Volatile Organic Compound Analysis

Analyte	Required Analytical Method	Required Detection Limit (ug/kg)	Actual Analytical Method	Actual Detection Limit (ug/kg)
Methylene Chloride	8240	740	8260A	630
Tetracholorethene	8240	740	8260A	630
Trichloroethene	8240	740	8260A	630
1,1,1-Trichloroethane	8240	740	8260A	630

The accuracy of laboratory alpha spectroscopy data was evaluated with respect to detection limits. Table E-6 provides a comparison between required detection limits and actual detection limits. As can be seen in Table E-6 the actual detection limit meets the required detection limit for all radionuclides. Therefore, accuracy from alpha spectroscopy detection limits were adequate for all sample analyses for decision making purposes.

Table E-6 Comparison of Detection Limits – Alpha Spectroscopy

Analyte	Required Analytical Method	Required Detection Limit (pCi/g)	Actual Detection Limit (pCi/g)
$^{239/240}$Pu	RC01B003	0.3	0.3
^{241}Am	RC01B003	0.3	0.3
$^{233/234}$U	RC01B003	1.0	1.0
^{235}U	RC01B003	1.0	1.0
^{238}U	RC01B003	1.0	1.0

Two types of QC samples were generated in support of the VOC subsurface soil investigation; rinse blanks and trip blanks. Table E-7 provides a summary of QC sample and associated real samples showing where methylene chloride is considered a true detect.

Table E-7—Quality Control Sample Summary

QC Sample ID	QC Sample Type	Assoc. Real Sample(s)	Analyte(s) Detected in QC Sample	Detect in Real Samples Associated Method Blank (yes/no)	Comments
BH17006 RM	trip blank	BH17000RM BH17001RM BH17003RM BH17004RM	Methylene chloride	yes	Methylene chloride detections in real samples >10 times the detection in the QC sample. Result will be considered true detects (EPA, 1989).

Acetone and methylene chloride were detected in numerous real samples as shown in Table 2-3 as well as in trip blanks and rinse blanks as summarized in Table E-8. Acetone is considered a laboratory contaminant as well as methylene chloride with the exception of the detections from borings 17097 and 17197 where the concentrations exceeded ten times the detection in the associated trip blank and was not detected in the associated method blank.

Table E-8—Quality Control Sample Results

Borehole No.	QC Sample ID	QC Sample Type	Acetone (ug/L)	Methylene Chloride (ug/L)
17097 and 17197	BH17006RM	trip blank	7.3 J	4.1 J
17297 and 17397	BH17011RM	trip blank	<100	4.8 JB
17497 and 17597	BH17017RM	trip blank	5.5 J	<5.0
17697	BH17002RM	rinse blank	< 100	<5.0
17797	BH17021RM	trip blank	5.8 J	2.2 J
17897	BH17022RM	trip blank	<100	7.5 B
17997, 18097, and 18197	GW17004RM	trip blank	<100	2.7 JB
17997	GW17005RM	rinse blank	<100	3.6 JB
18297, 18397, and 18497	BH17030RM	trip blank	<100	7.9 B
18497	BH17035RM	rinse blank	<100	3.4 JB
18597 and 18697	BH17036RM	trip blank	3.0 J	8.3 J
18797 and 18897	BH17039RM	trip blank	<100	2.3
18897	GW17008RM	trip blank	<100	5.2 B
18997	BH17048RM	trip blank	<100	16.0 B

Representativeness

The discussion of representativeness is limited to an evaluation of whether analytical results for field samples are truly representative of environmental concentrations or whether they may have been influenced by the introduction of contamination during collection and handling. This is assessed by evaluating results of various blanks, specifically rinsates and trip blanks (Table E-8).

Possible introduction of contamination from sampling equipment is evaluated by examination of the analytical results for equipment rinsates. Equipment rinsates are used to assess the proficiency of the decontamination process and possible cross-contamination between real samples. They are samples of distilled water that have been poured over or through decontaminated sampling equipment and subsequently handled in the same manner as real samples. Although rinsates are used specifically as indicators of cross-contamination during decontamination of equipment, they are carried through the entire sampling, shipping, and laboratory process and are, consequently, also good indicators of possible introduced contamination during any of these steps.

Trip blanks are used as general indicators of potential cross-contamination by VOCs, and are often used to assess migration of VOCs from the air or shipping containers through the same containers septum or lid into the sample. EPA considers acetone and methylene chloride to be common laboratory contaminants. These compounds were detected in various blanks (Table E-8). In accordance with EPA guidance (EPA, 1989) methylene chloride was observed in real samples from two boreholes with concentrations greater than ten times the concentration that appeared in the method blank or associated trip blank. However, most detections of acetone and methylene chloride are associated with a detection with their respective method blank, trip blank, or rinse blank and are considered to be laboratory contaminants.

Completeness

Investigative samples were collected in accordance with the SAP (RMRS, 1997) as summarized in Table 2-2 and below in Table E-9. Due to shallow groundwater conditions an average of 1.9 VOC soil samples per borehole were collected instead of the proposed three per borehole for a completeness of 63%. All other samples were collected as specified in the SAP for a completeness of 100%. The subsurface VOC data is adequate to characterize subsurface soil conditions in the investigation area. No additional subsurface soil samples are required.

Table E-9 Planned vs. Actual Sample Comparison

Analysis	Sample Media (Type)	Planned No. of Samples (per SAP)	Actual Number of Samples Collected	Deviation	Justification
VOA by 8240	Subsurface Soil (BH)	60-120	38	-22	Shallow depth to groundwater encountered, limited number of samples collected per SAP.
VOA Screening	Groundwater (GW)	5-10	6	0	
TCLP-Metals	Drill Cuttings (BP)	15-30	20	0	
Alpha Spec	Surface Soil (SS)	3	3	0	

Comparability

Analytical methods and sampling techniques remained consistent for each analyte group over the sampling period. Laboratory analyses were performed in accordance with standard SW-846/8260A and VOC screening, CLP Metals, and alpha spectroscopy protocols and results are comparable to data produced by similar methods at other laboratories.

Action Items:

1. The following sample results were qualified as estimated (UJ/J) due to the percent relative standard deviations (%RSDs) which exceeded 30% in the initial calibration:

   - Acetone, methylene chloride, 2,2-dichloropropane, 4-methyl-2-pentanone, 2-hexanone, and naphthalene in all samples **[140]**

2. The following sample results were qualified as estimated (UJ/J) due to the percent differences (%Ds) which exceeded 25 % in the continuing calibrations:

   - 2,2-Dichloropropane in all samples
   - 2-Hexanone in samples BH17000RM and BH17017RM **[141]**

3. The following sample results were reported as estimated and undetected (UJ) due to blank contamination:

   - Methylene chloride in sample BH17005RM **[149]**

Comments:

1. The chain of custody records did not indicate the temperature of the samples upon receipt. No action is necessary since the affect of temperature on the samples is unknown. **[231]**

N Item was not reviewed or non-compliance was not identified
N/A Item is not applicable to the Line Item

211

Action Items:

1. The following sample results were qualified as estimated (J) due to the percent relative standard deviations (%RSDs) which exceeded 30% in the initial calibration:

   - Acetone in all samples
   - Methylene chloride in all samples
   - 2,2-Dichloropropane in all samples
   - 4-Methyl-2-pentanone in all samples
   - 2-Hexanone in all samples
   - Naphthalene in all samples **[140]**

2. The following sample results were qualified as estimated (J) due to the percent differences (%D) which exceeded 25 % in the continuing calibrations:

   - 2,2-Dichloropropane in all samples
   - 2-Hexanone in samples BH17028RM, BH17029RM, GW17002RM, GW17003RM, GW17004RM, GW17005RM, GW17006RM, GW17007RM **[141]**

3. The following sample results were reported as undetected due to blank contamination, according to the Functional Guidelines criteria (5x rule):

   - Methylene chloride in samples BH17028RM, BH17029RM, BH17030RM, GW17002RM, GW17003RM, GW17004RM, and GW17005RM **[149]**

Comments:

1. The chain of custody records did not indicate the temperature of the samples upon receipt. No action is necessary since the affect of temperature on the samples is unknown. **[231]**

2. The percent recovery of trichloroethene (83%) was below the QC limits of 85% to 121%, in the matrix spike duplicate (MSD) analysis of sample GW17002RM. MS/MSD analyses was not performed for the soil matrices. The VA970902 LCS/LCSD analyses performed on 09/02/97 were utilized for both the soil and a water matrices with different QC criteria. No action is taken because sample results are not qualified based solely on MS/MSD recoveries. **[114]**

3. The method blank VA970902-1MB was utilized for both soil and water matrices. No action is taken. **[168]**

Action Items:

1. The following sample results were qualified as estimated (J) due to the CRDL percent recovery criteria were not met:

   - Chromium in all samples
   - Iron in all samples
   - Magnesium in all samples
   - Nickel in all samples
   - Potassium in all samples
   - Thallium in all samples
   - Zinc in all samples **[105]**

2. The following sample results were qualified as estimated and undetected (UJ) due to elevated blank levels:

   - Arsenic in all samples
   - Cadmium in all samples
   - Copper in sample BP17006RM
   - Lead in sample BP17005RM
   - Nickel in sample BP17006RM
   - Selenium in sample BP17006RM
   - Silver in sample BP17006RM
   - Thallium in sample BP17005RM
   - Vanadium in all samples
   - Tin in all samples **[107]**

3. The following sample results were qualified as rejected R due to elevated blank leves above the CRDL:

   - Sodium in all samples **[159]**

Comments:

1. The case narrative states the matrix spike (MS) and matrix spike duplicate (MSD) were performed on SDG 97A2437. The MS/MSD percent recovery and relative percent difference for this SDG were within criteria.

2. The case narrative states the ICP serial dilution were performed on SDG 97A2437. The ICP serial dilution percent recovery for this SDG were within criteria

I METAL ANALYSIS PARAMETERS WORKSHEET -- HOLDING TIMES

MATRIX: Solid BATCH: 97A2439 QU#: _____

SAMPLE ID	PRE-SERVED Y/N	DATE COLLECTED	ICP ANALYSIS DATE	As AA ANALYSIS DATE	Pb AA ANALYSIS DATE	Se AA ANALYSIS DATE	Tl AA ANALYSIS DATE	Hg CVAA ANALYSIS DATE	CN ANALYSIS DATE	Cs ANALYSIS DATE	ACTION	REASON
01	y	8/20/97	9/16/97					9/3/97			None	w/in criteria
02	y	↓	↓					↓			↓	↓

COMMENTS

Actions:
1. If holding times are exceeded, all sample results are estimated (J).
2. If holding times are grossly exceeded (>= 2*holding time), detected results are estimated (J), and non-detected results are rejected (R).
3. If metals pH > 2, all sample results are estimated (J).
4. For cyanide samples:
   a. If the pH is greater than or equal to 12, no action is taken.
   b. If the pH is greater than or equal to 8 and less than 12, sample results are estimated (J).
   c. If the pH is less than 8, detected results are estimated (J), and non-detected results are rejected (R).

Reasons:
1. Holding times were exceeded.
2. Holding times were grossly exceeded.
99. See hard copy for further explanation.

II B METAL ANALYSIS PARAMETERS WORKSHEET -- AA CALIBRATIONS

BATCH: _____

List all AA analytes that did not meet the percent recovery criteria for the ICV and/or CCV standards.

ICV CCV	ANALYTE	TRUE	FOUND	% R	ACTION	SAMPLES AFFECTED	REASON

1. Were the correct number of standards and blanks used to calibrate the instrument? Yes No

2. Is the initial calibration correlation coefficient > 0.995? Yes No

If no, list affected analytes and samples.

COMMENTS

Actions:

	PERCENT RECOVERY				
	<75%	75-89%	90-110%	111-125%	>125%
Detected results	R	J	V	J	R
Non-detected Results	R	UJ	V	V	V

1. If three standards and a blank were not used for initial calibration, or the instrument was not calibrated daily and each time the instrument was set up, qualify the data as rejected (R).
2. If the initial calibration correlation coefficient was less than 0.995, qualify sample results as estimated (J).

Reasons:

3. Initial calibration correlation coefficient <0.995.
4. Calibration verification criteria were not met.
6. Incorrect calibration of instrument.

III METAL ANALYSIS PARAMETERS WORKSHEET -- BLANKS

MATRIX: Solid BATCH: 97A2439

List the largest positive AND negative blank result >=|IDL| below. Use one worksheet for soil matrix and another for water matrix.

ICB CCB MB	IDL	ANALYTE	BLANK CONC.	5 * Bl. Conc.	ACTION LEVEL	SAMPLES AFFECTED	REASON
MB	2.5	As	4.580	22.9	UJ	all	107
MB	0.3	Cd	0.51	2.55	UJ	all	107
MB		Cu	2.935		UJ	02	107
MB	1.2	Pb	1.256		UJ	01	
MB		Ni			UJ	02	
ICB		Se	3.0		UJ	02	
CCB5		Ag	1.8		UJ	02	
MB		Na	1596000		UJ	all	
CCB5		Tl	2.7		UJ	01	
CCB4		V	0.8		UJ	all	
CCB4		Sb	2.5		UJ	all	

COMMENTS

Actions:

Use the MB or ICB/CCBs with the highest concentration, positive and negative, from the associated run.

1. If |Blank| < IDL, no action is taken.
2. If Blank >= IDL, then all sample results >= IDL and < 5*Blank are estimated (UJ).
3. If Blank =< -IDL, all sample results >= IDL and < 5*|Blank| are estimated (J).
4. If Blank =< -IDL and raw data sample result is =< IDL:
   a. If |Blank-Sample| >= 2*IDL, then non-detected results are rejected (R).
   b. If |Blank-Sample| >= IDL and < 2*IDL, then non-detected results are estimated (UJ).
   c. If |Blank-Sample| < IDL, then no action is taken.

Reasons:

7. Analyte values >= IDL were found in the blanks.
8. Negative bias was indicated in the blanks.

V A METAL ANALYSIS PARAMETERS WORKSHEET -- PRE-DIGESTION MATRIX SPIKE

MATRIX: _____ BATCH: _____

List all parameters that do not meet the percent recovery criteria. Note: The pre-digestion spike recovery criteria are not evaluated for Ca, Mg, K, Na, Al, and Fe for soil samples, and Ca, Mg, K, and Na for water samples.
If the sample result exceeds the spike added by a factor of 4 or more, no action is taken.

SAMPLE ID	ANALYTE	SPIKED SAMPLE RESULT	SAMPLE RESULT	SPIKE ADDED	% R	ACTION	SAMPLES AFFECTED	REASON
NA								
Just case narrative states MS/MSD analyzed for another batch of sample and was w/ in criteria								
11	Hg					None	w/in criteria	

1. Was a pre-digestion matrix spike prepared at the required frequency of once every 20 samples, or every SDG (whichever is more frequent)? Yes No
2. Was a post-digestion matrix spike analyzed for all ICP elements, except Silver, that did not meet the pre-digestion matrix spike recovery criteria? Yes No

COMMENTS

1. If any analyte does not meet the % R criteria, qualify all associated samples using the following criteria:
Actions:

	Percent Recovery			
	<30%	30-74%	75-125%	>125%
Detected results	J	J	V	J
Non-detected results	R	UJ	V	V

Reasons:
12. Pre-digestion matrix spike recovery were not met (+/- 25 percent).
13. Pre-digestion matrix spike recovery criteria were not met (<30 percent).

VIII METAL ANALYSIS PARAMETERS WORKSHEET -- FURNACE AA ANALYSIS

BATCH: _____

If the sample result is > 50% of the spike result and the percent recovery was between 40--84% or >115%, then MSA must be performed.

List all samples for which an MSA analysis was required but not performed, or MSA results were outside control limits.

ANALYTE	SAMPLE ID	CORR. COEFF.	ACTION	COMMENT	REASON

Actions:

1. Estimate (J) if an MSA was required and not performed.
2. If the correlation coefficient was < 0.995, the MSA should be performed a second time. Estimate (J) results greater than IDL, and estimate (UJ) non-detects if a reanalysis was not performed, or the reanalysis correlation coefficient was < 0.995.

List all samples > CRDL whose duplicate injections did not agree within 20% RSD or CV, or samples in which duplicate injections were not performed

ANALYTE	SAMPLE ID	SAMPLE RESULT	DUPLICATE RESULT	%RSD or CV	IDL	ACTION	COMMENT	REASON

*Spike result = |spiked sample result – sample result|

Actions:

1. Estimate (J) detected results greater than the CRDL if duplicate injections are outside 20% RSD.
2. Estimate (J) all sample results if duplicate injections were not performed.

Reasons:

15. MSA was required but not performed.
16. MSA calibration correlation coefficient < 0.995.
20. AA duplicate injection precision criteria were not met.

XI METAL ANALYSIS PARAMETERS WORKSHEET -- DETECTION LIMIT RESULTS

BATCH: 97A2439

YES OR NO	
	1. Instrument Detection Limits
Y	Instrument Detection limits were present and found to be less than CRDL
Y	IDLs were included in the data package on Form X.
Y	IDLs were obtained within 3 months of, and preceding, the sample analysis. If no, request data resubmittal.
	List the analytes for which the IDL criteria were not met:
	2. Reporting Requirements
Y	Were sample results on Form I reported down to the IDL not the CRDL for all analytes?
NA	Were sample results that were analyzed by ICP for Se, Tl, As, or Pb at least 5*IDL if IDL was > CRDL?
Y	Were sample weights, volumes, percent solids, and dilutions taken into account when reporting results on Form I?
	If No on any of the above, the reported results may be inaccurate. Make necessary changes on the data summary tables and request that the laboratory resubmit corrected Form I's.
	COMMENTS

Reasons:
25. Primary standard had exceeded expiration date.
26. No raw data.
52. Transcription error.
53. Calculation error.
55. Result exceeds linear range; serial dilution value reported.
56. IDL changed due to significant figure discrepancy.
57. Percent solids < 30 percent.
58. Percent solids < 10 percent.
99. See hardcopy for further explanation.

02	↓	↓	↓					↓				
03												
04												
05	↓	↓	↓					↓				

COMMENTS

Actions:
1. If holding times are exceeded, all sample results are estimated (J).
2. If holding times are grossly exceeded (>= 2*holding time), detected results are estimated (J), and non-detected results are rejected (R).
3. If metals pH > 2, all sample results are estimated (J).
4. For cyanide samples:
   a. If the pH is greater than or equal to 12, no action is taken.
   b. If the pH is greater than or equal to 8 and less than 12, sample results are estimated (J).
   c. If the pH is less than 8, detected results are estimated (J), and non-detected results are rejected (R).

Reasons:
1. Holding times were exceeded.
2. Holding times were grossly exceeded.
99. See hard copy for further explanation.

VERSION 1.1
NOVEMBER 1992

V A METAL ANALYSIS PARAMETERS WORKSHEET -- PRE-DIGESTION MATRIX SPIKE
MATRIX: _____ BATCH: _____

List all parameters that do not meet the percent recovery criteria. Note: The pre-digestion spike recovery criteria are not evaluated for Ca, Mg, K, Na, Al, and Fe for soil samples, and Ca, Mg, K, and Na for water samples.
If the sample result exceeds the spike added by a factor of 4 or more, no action is taken.

SAMPLE ID	ANALYTE	SPIKED SAMPLE RESULT	SAMPLE RESULT	SPIKE ADDED	% R	ACTION	SAMPLES AFFECTED	REASON
NA								
Best case narrative ~~statis~~ MS/MSD analyzed for another batch of sample and ~~w/ w/o~~ was w/in criteria								

1. Was a pre-digestion matrix spike prepared at the required frequency of once every 20 samples, or every SDG (whichever is more frequent)? Yes No
2. Was a post-digestion matrix spike analyzed for all ICP elements, except Silver, that did not meet the pre-digestion matrix spike recovery criteria? Yes No

COMMENTS

1. If any analyte does not meet the % R criteria, qualify all associated samples using the following criteria:
Actions:

	Percent Recovery			
	<30%	30-74%	75-125%	>125%
Detected results	J	J	V	J
Non-detected results	R	UJ	V	V

Reasons:
12. Pre-digestion matrix spike recovery were not met (+/- 25 percent).
13. Pre-digestion matrix spike recovery criteria were not met (<30 percent).

VB METAL ANALYSIS PARAMETERS WORKSHEET -- ANALYTICAL SPIKE ANALYSIS

BATCH: _____

1. Spike Recovery: One point analytical spikes were performed for all samples? Yes No
List all samples that did not meet the 85–115 % recovery criteria.

ANALYTE	SAMPLE ID	SAMPLE RESULT	SPIKED SAMPLE RESULT	TRUE SPIKE VALUE	%R	ACTION	COMMENT	REASON
NA								

QUANTALEX, INC.

VERSION 1.1
NOVEMBER 1992

VI METAL ANALYSIS PARAMETERS WORKSHEET -- LABORATORY DUPLICATES

MATRIX: Solid / Water BATCH: 9TA244 2

List all parameters that do not meet % difference or CRDL criteria.

SAMPLE ID	ANALYTE	SAMPLE VALUE	DUP. VALUE	RPD	DIFFERENCE	ACTION	SAMPLES AFFECTED	REASON
						None	w/in criteria	

QUANTALEX, INC.

VERSION 1.1
NOVEMBER 1992

VII METAL ANALYSIS PARAMETERS WORKSHEET--LAB CONTROL SAMPLES

MATRIX: Solid / Water BATCH: 97A2412

List all parameters that do not meet the percent recovery criteria.

LCS ID	ANALYTE	TRUE VALUE	FOUND VALUE	% R	ACTION	SAMPLES AFFECTED	REASON
					None	w/in criteria	
COMMENTS							

Exception: antimony, silver, cyanide, and aqueous mercury have no control limits.

Actions:

	PERCENT RECOVERY			
1. AQUEOUS LCS	<50%	50–79%	80–120%	>120%
Detected results	J	J	V	J
Non-detected results	R	UJ	V	V

2. SOLID LCS

	BELOW CONTROL LIMITS	WITHIN CONTROL LIMITS	ABOVE CONTROL LIMITS
Detected results	J	V	J
Non-detected results	UJ	V	V

Reasons:

10. Lab Control Sample recovery criteria were not met.

VERSION 1.1
NOVEMBER 1992

METAL ANALYSIS PARAMETERS WORKSHEET -- FURNACE AA ANALYSIS

BATCH: _____

If the sample result is > 50% of the spike result and the percent recovery was between 40–84% or >115%, then MSA must be performed.
List all samples for which an MSA analysis was required but not performed, or MSA results were outside control limits.

ANALYTE	SAMPLE ID	CORR. COEFF.	ACTION	COMMENT	REASON

Actions:
1. Estimate (J) if an MSA was required and not performed.
2. If the correlation coefficient was < 0.995, the MSA should be performed a second time. Estimate (J) results greater than IDL, and estimate (UJ) non–detects if a reanalysis was not performed, or the reanalysis correlation coefficient was < 0.995.

List all samples > CRDL whose duplicate injections did not agree within 20% RSD or CV, or samples in which duplicate injections were not performed

ANALYTE	SAMPLE ID	SAMPLE RESULT	DUPLICATE RESULT	%RSD or CV	IDL	ACTION	COMMENT	REASON

*Spike result = |spiked sample result – sample result|

Actions:
1. Estimate (J) detected results greater than the CRDL if duplicate injections are outside 20% RSD.
2. Estimate (J) all sample results if duplicate injections were not performed.

Reasons:
15. MSA was required but not performed.
16. MSA calibration correlation coefficient < 0.995.
20. AA duplicate injection precision criteria were not met.

VERSION 1.1
NOVEMBER 1992

IX METAL ANALYSIS PARAMETERS WORKSHEET -- ICP SERIAL DILUTION ANALYSIS

MATRIX: _____ BATCH: _____

Serial dilution criteria only applies if the original sample result is at least 50*IDL and %D >10%.

ANALYTE	IDL	50*IDL	SAMPLE RESULT	SERIAL DILUTION RESULT	% D	ACTION	SAMPLES AFFECTED	REASON
NA								
But case narrative states serial dilution analyzed for another batch of sample and was w/in criteria.								

INDUCTIVELY COUPLED PLASMA SERIAL DILUTION ANALYSIS:

Serial dilutions were performed for each matrix and results of the diluted sample analysis agreed within ten percent of the original undiluted analysis. Yes No

Serial dilutions were not performed for the following:

COMMENTS

Actions:
Estimate (J) detected results if %D is > 10%.

Reasons:
17. Serial dilution criteria were not met.

# of calculations checked _____
# of calculations checked (technical review) _____

VERSION 1.1
NOVEMBER 1992

X METAL ANALYSIS PARAMETERS WORKSHEET -- SAMPLE RESULT VERIFICATION

MATRIX: Solid / Water BATCH: 97A2242

1. Describe any raw data anomalies (i.e. baseline shifts, negative absorbances, legibility, etc.)

None

2. Describe any transcription or calculation errors.

None

3. Do any results fall outside the linear range of the ICP instruments, as reported on EPA Form XII, that were not reanalyzed? Yes (No)

If yes, list all affected analytes and samples:

4. Were linear ranges obtained within 3 months of, and preceding, the sample analyses? (Yes) No

If no, request data resubmittal.

5. Do any results fall outside the calibrated range of the instrument for AA or Cyanide and were not reanalyzed? Yes No

If yes, list all affected analytes and samples: N/A

6. Were interelement corrections obtained within 12 months of, and preceding, the sample analyses? (Yes) No

If no, request data resubmittal.

COMMENTS

VERSION 1.1
NOVEMBER 199

XI METAL ANALYSIS PARAMETERS WORKSHEET -- DETECTION LIMIT RESULTS

BATCH: _____

YES OR NO	
	1. Instrument Detection Limits
Y	Instrument Detection limits were present and found to be less than CRDL.
Y	IDLs were included in the data package on Form X.
Y	IDLs were obtained within 3 months of, and preceding, the sample analysis. If no, request data resubmittal.
	List the analytes for which the IDL criteria were not met:
	2. Reporting Requirements
Y	Were sample results on Form I reported down to the IDL not the CRDL for all analytes?
N/A	Were sample results that were analyzed by ICP for Se, Tl, As, or Pb at least 5*IDL if IDL was > CRDL?
Y	Were sample weights, volumes, percent solids, and dilutions taken into account when reporting results on Form I?
	If No on any of the above, the reported results may be inaccurate. Make necessary
	changes on the data summary tables and request that the laboratory resubmit corrected Form I's.
	COMMENTS

Reasons:
25. Primary standard had exceeded expiration date.
26. No raw data.
52. Transcription error.
53. Calculation error.
55. Result exceeds linear range; serial dilution value reported.
56. IDL changed due to significant figure discrepancy.
57. Percent solids < 30 percent.
58. Percent solids < 10 percent.
99. See hardcopy for further explanation.

IHSS's 170, 174A & 174B Property Utilization & Storage Yard Location Map Figure 1-1

EXPLANATION

- OU10 IHSS
- Oil Stain Location
- New RFCA Groundwater Monitoring Wells under FY97 WARP
- Groundwater well location
- Power Poles
- Soil-Gas Sampling Location
- Soil-Gas Sampling Location with concentrations of volatile organic compounds equal to or above the detection limit of 1.0 microgram per liter (*See note)
- Surface Soil Sample with Volatile Organic Compounds detected

Standard Map Features

- Buildings or other structures
- Streams, ditches, or other drainage features
- Fences and other barriers
- Paved roads
- Dirt roads
- Contours (5 foot)

DATA SOURCE:
Buildings, fences, hydrography, roads and other structures from 1994 aerial fly-over data captured by EG&G RSL, Las Vegas.
Digitized from the othophotographs. 1/95

NOTE:
Concentrations are in ug/L

ACE = Acetone
BZ = Benzene
CH4 = Methane
PCE = Tetrachloroethene
TCA111 = 1,1,1-Trichloroethane
TCE = Trichloroethene

Scale = 1 : 1400
1 inch represents approximately 117 feet

25 0 50 100ft

State Plane Coordinate Projection
Colorado Central Zone
Datum: NAD27
