EXECUTIVE SUMMARY

Groundwater sampling for the third quarter, 1999 included 80 locations. Of these, seven wells were completely dry and a further nine wells yielded only enough water to collect a partial analytical suite.

TIER I REPORTABLE RESULTS

There was one reportable analytical result that was above the **Tier I Action Level** in the third quarter of 1999. Results from Plume Extent well 22896 showed that trichloroethene was above the Tier I Action Level. The well is being monitored routinely because the trichloroethene (by inspection) has been this high and is not obviously increasing.

TIER II REPORTABLE RESULTS

Boundary Wells: Six Boundary wells were visited in the third quarter. One reportable result for nickel in well 41591 was found.

Boundary well 41591 had non-reportable results for uranium-233/234 and uranium-238 that were above the Tier II Action Levels and below the Background M2SDs. The reportable nickel result in 41591 was above the Tier II Action Level, the Background M2SD and Historic M2SD. This result was the second of 3 monthly sampling events. Two of the three nickel samples were above the Tier II Action Level. The well will be returned to a routine sampling schedule. This report constitutes notification of the appropriate authorities as required by the IMP.

Deactivation & Decommission Wells: No reportable results were encountered in the nine Deactivation and Decommission wells sampled in the third quarter of 1999. Six of these wells contained analytes that exceeded their respective Tier II Action Levels. Two new locations, 40199 and 40299 are discussed in this report for the first time. They are associated with Building 444 D&D.

Drainage Wells: Four Drainage wells were visited and sampled during the third quarter of 1999. Three of the wells contained analytes that exceeded Tier II Action Levels one of the wells was dry. Well 6586 had a reportable occurrence of nickel.

Drainage well 6586 had a reportable occurrence of nickel that was above the Tier II Action Level, the Background M2SD and the Historic M2SD for the well. The well has a recent history of high nickel values and has been sampled on a monthly basis so routine sampling is all that is required.

Performance Monitoring Wells: Twelve Performance monitoring locations were visited in the third quarter, eleven of these had analytes with concentrations that exceeded Tier II Action Levels. One Performance Monitoring well was dry. There were no reportable results for Performance Monitoring locations.

Performance Monitoring well 07391 from the Ryan's Pit area contained nine analytes that while not reportable were present in quantities above the Tier II Action Levels. The analytes include 1,1,1-trichloroethane, chloroform, methylene chloride, nitrate, tetrachloroethene, trichloroethene, uranium-233/234, uranium-235 and uranium-238. Because the results discussed here are not reportable exceedences well 07391 will continue to be monitored on a routine semi-annual basis.

Performance Monitoring well 15699 from the Mound area contained seven analytes that exceeded the Tier II Action Levels. The seven analytes include 1,1-dichloroethene, 1,2-dichloroethane, cis-1,2-dichloroethene, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238. None of these results are reportable. Routine quarterly monitoring of well 15699 will continue.

Performance Monitoring location SW13494 from the 881 Hillside exhibited non-reportable results for tetrachloroethene, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The third quarter 1999 tetrachloroethene results were high but within the normal range for the site, i.e. below the Historic M2SD. However, the tetrachloroethene trend plot may be showing an increase in concentration with time. Routine monitoring of SW13494 will continue.

Plume Definition Wells: Eight Plume Definition wells were visited in the third quarter of 1999. All eight wells had at least one analytical result above the Tier II Action Level. There were no reportable analytical results associated with these wells.

Plume Definition well 00597 contained nitrate that exceeds the Tier II Action Level. The nitrate concentration was also above the Background M2SD. The nitrate concentration has been slowly increasing since the first sample was collected in late 1997. Well 00597 is on a routine sampling schedule.

Plume Degradation Wells: Twelve Plume Degradation wells were visited in the third quarter of 1999. Two of these wells were dry. Eight of the remaining ten wells had non-reportable analyte occurrences that were above the Tier II Action Levels.

Plume Degradation wells are a relatively new category of IMP well, this is the first time they have been included in this report.

Six of the eight Plume Degradation wells in the IHSS 118.1 group, 18199 to 18899, commonly contained non-reportable carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene along with other organic compounds peculiar to each well. This report covers the second time these wells have been sampled so no trend plots are available.

Plume Degradation well 90099 to 90399 in the Ryan's Pit Plume/903 Pad area. Wells 90099 and 90399 contained non-reportable carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene. This is the first sampling event for these wells.

Plume Extent Wells: Twenty-one Plume extent wells were visited in the third quarter, two of these were dry. Of the nineteen Plume Extent wells sampled sixteen wells had analytes that exceeded Tier II Action Levels. From these sixteen wells five wells had a total of 10 reportable analytical results.

Plume Extent well 06091 had a reportable occurrence of carbon tetrachloride. This sample event represents the last of three monthly samples each of which indicate a slowly increasing amount of carbon tetrachloride in the well. This report constitutes notification of increased carbon tetrachloride at well 06091. The well will be returned to routine semi-annual monitoring.

Plume Extent well 10994 contained a reportable quantity of selenium. The selenium was above the Tier II Action Level and Background M2SD, but below the Historic M2SD. The well will be monitored on a routine basis.

Plume Extent well 22896 had reportable amounts of methylene chloride, trichloroethene and nitrate. Each of these compounds exceeded its Tier II Action Level the trichloroethene was above the **Tier I** Action Level. The nitrate exceeded the Background M2SD. These compounds do not show distinct increasing trends given the available data. Well 22896 will be monitored on a routine basis.

Plume Extent well 23296 contained reportable amounts of cis-1,2-dichloroethene, tetrachloroethene and trichloroethene. By inspection: the cis-1,2-dichloroethene result is the highest recorded at this well for this compound. The tetrachloroethene and trichloroethene are within their normal ranges.

5

This report constitutes notification of the high cis-1,2-dichloroethene results at well 23296. Monthly monitoring of this well for VOCs will begin as soon as possible.

Plume Extent well 3586 had reportable amounts of vinyl chloride and manganese. The vinyl chloride was below its Historic M2SD. The manganese was well above the Background M2SD but below its Historic M2SD. Routine monitoring of well 3586 will continue.

RCRA Monitoring Wells: Eight RCRA monitoring wells were visited in the third quarter of 1999. One well was dry. Of the seven sampled wells, two wells exhibited five reportable results.

Downgradient RCRA Monitoring well 4087 contained reportable sulfate. The sulfate was above the Background M2SD but below the well's Historic M2SD. Only routine monitoring is required.

Upgradient RCRA Monitoring well 70393 held non-reportable quantities of 1,1-dichloroethene, tetrachloroethene and trichloroethene. The concentrations of these compounds were below the Historic M2SDs for this well. Routine monitoring will be continued at this wellsite. Results for these compounds were erroneously listed as reportable in the Second Quarter 1999 Groundwater Report. Because well 70393 is upgradient they should have been recorded as non-reportable.

Downgradient RCRA Monitoring well B206989 had reportable lithium, selenium, nitrate and uranium-235. The lithium, selenium, nitrate and uranium-235 concentrations are above the Background M2SDs. The nitrate is below its Historic M2SD. Well B206989 commonly does not provide enough water for a complete sample suite. Therefore few Historic M2SDs and trend plots are available. None of the analytes show a distinct increasing trend with the available data. Routine monitoring at B206989 will continue.

1.0 INTRODUCTION

This report is required by Section 3.4.B of Attachment 5 of the Rocky Flats Cleanup Agreement (RFCA) (EPA, CDPHE, and DOE, 1996) and described in the Integrated Monitoring Plan (IMP) (DOE, 1998).

The DOE/K-H/RMRS team has completed evaluation of third quarter (July-August-September) 1999 groundwater analytical data using updated groundwater action level criteria as described in RFCA Attachment 5 (Kaiser-Hill, 1999). The sampling for the third quarter of 1999 reflects the approval of the monitoring well list (CDPHE, Nov. 1996 and EPA, Nov. 1996) and the establishment of semi-annual sampling frequencies. Therefore, only a portion of the RFCA monitoring wells are sampled and reported each quarter. The remainder will be sampled in the following quarter as site conditions allow. RFCA groundwater monitoring locations and three sump/drain locations (see below) are included in this report. The locations sampled during the third quarter, 1999 are listed in Table 3-1. The locations of the sampled sites are shown in Figure 1 except as noted below.

Data for Plume Degradation wells 18199 through 18899 (18899 has been dry) at IHSS 118.1 site are included in this report. Results from newly installed locations included in this report are Plume Degradation wells 90099 through 90399 (90299 was dry) from the 903 Pad / Ryan's Pit Plume area and Deactivation and Decommissioning (D&D) wells 40199 and 40299 from the Building 444 area. Data gathered from these wells will henceforth continue to be reported in this series of Quarterly Groundwater Reports. As yet coordinates for the 400 and 900 series of 1999 wells are not available so they do not appear on the location map, Figure 1.

More D&D wells were installed and sampled in the Fourth Quarter of 1999. Data received from these sampling events will be included in the Fourth Quarter Report.

In addition to monitoring wells cited in this report three other locations are included: 891COLGAL, 891COLWEL and SW13494. The 891 locations are pump equipped wells that collect water from the French Drain on the Building 881 hillside. Location SW13494 is a sump for the footing drain system of the 881 Building it also is located on the 881 hillside.

2.0 METHODS

The Groundwater Monitoring program attempted to collect and have analyzed 532 samples in the third quarter of 1999 under the Integrated Monitoring Plan (IMP) (DOE, 1998). Owing to dry wells and wells with insufficient water only 459 requests for analysis were actually sent out. (There were 40 samples related to dry wells and 33 related to insufficient water.)

By the beginning of January 2000 approximately 99% of the third quarter 1999 data were available electronically from the Soil and Water Database (SWD). In general it was not necessary to manually compile data from the laboratory report packages. $Cesium_{137}$ (four records) and methane (ten records) data derived from special task orders with the labs were not available electronically and were hand entered. Results for all analyses that were sent out have been returned.

The analytical results were uploaded from SWD into a local MS Access database maintained by the groundwater group. Data were examined for presence/absence and consistency. Duplications and mismatches were excluded. Field and laboratory QC data were identified for use in the data quality assessment section (Sec. 7.0) using a Rocky Mountain Remediation Services (RMRS) Procedure: Evaluation of Data for Usability in Final Reports (RMRS, 1998).

Results for all detected analytes (results without a "U" qualifier) were compared with Tier I and Tier II Action Level Framework (ALF) criteria. Results exceeding Tier I or Tier II action levels were further compared with the site-wide Background Mean plus Two Standard Deviations (M2SD) value and well-specific Historic Mean plus Two Standard Deviations (M2SD) value. The three ratios calculated as a result of these comparisons are used to identify IMP reportable results as described below. Volatile and Semi-Volatile Organic Compounds do not have background concentrations. The Historic M2SD is only calculated for wells with 5 or more sampling events collected during the years 1991 to 1995.

Table 3-2 represents a screen for any results that exceed the Tier II Action Levels. Table 3-2 is used to evaluate the reportable results via the Tier II, Background and Historic Ratios as described above and to help select analytes and wells which are of interest for site cleanup but which may not be reportable under IMP criteria.

Background values were taken from the Background Geochemical Characterization Report (DOE, 1993) with the exception of americium-241, plutonium-239/240, uranium-233/234, uranium-235, and uranium-238. Background values for these radionuclides were taken from the Draft Background Comparison for Radionuclides in Groundwater Report (DOE, 1997). Data were extracted directly from the SWD and/or the local groundwater database to calculate the historical M2SD for locations with analytes exceeding Tier II ALF criteria and to produce trend plots.

The groundwater monitoring network, as defined in the IMP (DOE, 1998), has eight categories of monitoring wells. The decision rule sequence presented in the IMP was followed for determining **Tier I** and **II** reportable results. The well types and decision rules are defined below:

<u>Plume Definition (PD) Monitoring Wells</u>: These wells are located within known contaminant plumes and are above **Tier II** action levels, but are below the **Tier I** action levels established in the ALF. A reportable result occurs when a measured concentration exceeds a **Tier I** action level **and** the background value **and** the M2SD of the historical concentration in the well. The required action is to reclassify as a **Tier I** reportable result well and evaluate possible impacts to surface water.

Plume Extent (PE) Monitoring Wells: These wells are located at the edges of known groundwater contaminant plumes, along pathways to surface water. These wells monitor for an increase in concentrations that may result in future impacts to surface water. A reportable result occurs if a measured concentration exceeds a **Tier II** action level **and** the background value. When there are no previous historical reportable results, **or** when a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of **Tier II** action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

Drainage (D) Monitoring Wells: These wells are located in stream drainages, downgradient of contaminant plumes. They have the same programmatic requirements as PE wells under the IMP. A reportable result occurs if a measured concentration exceeds a **Tier II** action level **and** the background value. When there are no historical reportable results, **or** a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of **Tier II** action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

Boundary (B) Monitoring Wells: These wells monitor ground water leaving the eastern Site boundary through the stream drainage channels. A reportable result occurs if a measured concentration exceeds a **Tier II** action level **and** the background value. When there are no historical reportable results, **or** a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of **Tier II** action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

D&D (DD) Monitoring Wells: These wells monitor for releases to groundwater from deactivation and decommissioning (D&D) activities. A reportable result occurs when a measured concentration exceeds the M2SD of the established historical baseline concentration downgradient of the building(s). The required action is to inform appropriate parties and initiate an evaluation of the situation.

Performance Monitoring (PM) Wells: These wells monitor the effect of a remediation or source removal action, as required in the ALF. If an increasing trend in the concentration of a contaminant is noted, then the appropriate parties are notified and an evaluation of the situation is initiated.

RCRA Monitoring Wells: These wells monitor downgradient groundwater contaminant concentrations at RCRA units. If the mean concentration of a contaminant in a downgradient well exceeds the mean concentration in upgradient wells **and** concentrations at the well show an upward trend with time, a report will be made to appropriate agencies and an investigation will be initiated to determine possible causes. This evaluation will be performed in the annual RFETS RFCA Groundwater Monitoring Report.

For the purposes of the quarterly reports, analytical results from downgradient RCRA wells will be treated in the same manner as Plume Extent wells. A reportable result for a RCRA well occurs if a measured concentration exceeds a **Tier II** action level **and** the background value. When there are no historical reportable results, **or** a value exceeds the M2SD of the historical concentration in the well when there have been historical reportable results of **Tier II** action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then appropriate parties are notified and the possible impacts to surface water are evaluated.

9

As noted above a review of the relative concentrations of upgradient and downgradient wells will be performed in an annual report.

Plume Degradation Monitoring Wells: These wells will be located either in downgradient areas that may be contaminated from a specific source or in associated upgradient areas. Data will be reviewed annually to determine if sufficient data have been collected to support remedial decision making. Upon collection of sufficient data an evaluation will be performed to establish inputs to the remedial conceptual model. This is a new category of IMP well and as yet no such wells are being sampled (DOE, 1998).

10

3.0 RESULTS

Groundwater sampling for the third quarter, 1999 included 80 locations. Of these, seven wells were completely dry and a further nine wells yielded only enough water to collect a partial analytical suite. Table 3-1 summarizes data collection activities for the third quarter of 1999. All sample results for the third quarter have been received as of this writing.

Major findings are presented in Table 3-2 and are summarized in the following discussion. Figure 1 illustrates the location of major plume boundaries relative to monitoring locations. Locations found to have reportable results of **Tier I** or **II**, action-level criteria are noted. Historic trends are shown for selected wells with analyte concentrations above **Tier I** or **Tier II Action Levels** (Figures 2-1 to 2-54). Other illustrated trends include organic compounds with concentrations exceeding **Tier II** action levels, and for any inorganic analytes with concentrations exceeding **Tier II** action levels **and** background M2SD. The RFCA requires that this information be reported quarterly.

3.1 TIER I REPORTABLE RESULTS

There was one reportable analytical result that was above the **Tier I** Action Level in the third quarter of 1999. Results from Plume Extent well 22896 showed that trichloroethene was above the Tier I level (Figure 2-32). The well is being monitored routinely because the trichloroethene by inspection has been this high and is not obviously increasing.

3.2 TIER II REPORTABLE RESULTS

Boundary Wells: Six Boundary wells were visited during the third quarter of 1999. There was one reportable result for nickel in Boundary well 41591.

Boundary wells 0386, 06491, 10294, 10394 and 41691 all had non-reportable uranium-233/234 and uranium-238 results that were above the Tier II Action Levels but below the Background M2SDs. These wells will continue to be monitored routinely.

Boundary well 41591 had non-reportable results for uranium-233/234 and uranium-238 that were above the Tier II Action Levels and below the Background M2SDs. Well 41591 had a reportable nickel result that was above the Tier II Action Level, the Background M2SD and Historic M2SD (Table 3-2 and Figure 2-38). This result was the second of three monthly sampling events initiated by the First Quarter 1999 Groundwater Report (RMRS,1999b). With respect to the monthly sampling as shown in Figure 2-38 the August result was below the Tier II Action Level, the September result is mentioned here, and the third result from October is lower than September but still above the Tier II Action Level for nickel. Monthly sampling for nickel is completed at well 41591. The well will be returned to a routine sampling schedule. This report constitutes notification of the appropriate authorities as required by the IMP. These authorities will now consider the implications of the nickel results for the well. (The well was dry in January, 2000 but was successfully sampled in February, 2000.)

Deactivation & Decommission Wells: No reportable results were encountered in the nine Deactivation and Decommission wells sampled in the third quarter of 1999. Six of these wells contained analytes that exceeded their respective Tier II Action Levels.

Deactivation and Decommission wells 10098, 10398 and 22996 had non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Levels but below the Background M2SDs. These wells will continue on their routine schedule of monitoring.

Deactivation and Decommission well 10298 contained a non-reportable result for molybdenum that was above the Tier II Action Level and Background M2SD for the metal. This is only the second result for metals obtained from the well (on 8/11/98 the molybdenum result was 178 µg/l). Routine monitoring will continue at the well.

Deactivation and Decommission well 10498 contained tetrachloroethene that was not reportable yet above the Tier II Action Level (Fig. 2-23). This result is approximately one third that of the previous sample collected in February, 1999. Given that only four samples have been collected at the well the tetrachloroethene concentration does not seem to be increasing. Well 10498 will continue to be monitored routinely.

Deactivation and Decommission well 40299 is a new installation associated with Building 444. The tetrachloroethene result for this the first sample event at the well exceeded the Tier II Action Level but is not reportable. Routine monitoring will continue at well 40299.

Drainage Wells: Four Drainage wells were visited and sampled during the third quarter of 1999. Three of the wells contained analytes that exceeded Tier II Action Levels one of the wells was dry. Well 6586 had a reportable occurrence of nickel.

Drainage well 00997 contained non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Levels but well below the Background M2SDs. Well 00997 will be monitored on a routine schedule.

Drainage well 38591 also had non-reportable amounts of strontium$_{89/90}$ (Figure 2-50), uranium-233/234 and uranium-238 that were above the Tier II Action Levels but below the Background M2SDs. Routine monitoring is all that is required at well 38591.

Drainage well 6586 had non-reportable quantities of uranium-233/234 and uranium-238 that were above the Tier II Action Levels and below the Background M2SDs. As mentioned above it also had a reportable occurrence of nickel that was above the Tier II Action Level, the Background M2SD and the Historic M2SD for the well (Table 3-2 and Fig. 2-39). Because similar high nickel values are present in the recent sampling history of the well and because a round of monthly samples has already been collected from the well no new sampling is anticipated at well 6586. Routine sampling will continue.

Performance Monitoring Wells: Twelve Performance monitoring locations were visited in the third quarter, eleven of these had analytes with concentrations that exceeded Tier II Action Levels. One Performance Monitoring well was dry. There were no reportable results for Performance Monitoring locations.

Performance Monitoring locations 00797, 10692, 15799 and 891COLGAL from the 881 Hillside all contained uranium-233/234 and uranium-238 at levels above the Tier II Action Level but below the Background M2SD. None of these results are reportable. Routine monitoring of these locations will continue.

Performance Monitoring well 05691 from the East Trenches area contained non-reportable quantities of carbon tetrachloride, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238. The carbon tetrachloride (Fig. 2-9), tetrachloroethene (Fig. 2-21) and trichloroethene (Fig. 2-30)are above their Tier II Action Levels but below their Historic M2SDs for the well. The uranium isotopes are above the Tier II Levels but well below the Background M2SDs. The schedule of routine monitoring will be maintained at well 05691.

12

Performance Monitoring well 07391 from the Ryan's Pit area contained nine analytes that while not reportable, were present in quantities above the Tier II Action Levels. The analytes include 1,1,1-trichloroethane, chloroform, methylene chloride, nitrate, tetrachloroethene, trichloroethene, uranium-233/234, uranium-235 and uranium-238. The; 1,1,1-trichloroethane (Fig. 2-1), chloroform (Fig. 2-4), tetrachloroethene (Fig. 2-22) and trichloroethene (Fig. 2-31) are above the Tier II Levels but below their Historic M2SDs. The concentrations of 1,1,1-trichloroethane, chloroform and trichloroethene do not appear to be increasing. The concentration of tetrachloroethene is in the high end of its range but may or may not be increasing. The methylene chloride (Fig. 2-14) and nitrate (Fig. 2-46) results are above Tier II, the Background M2SD in the case of nitrate, and above the Historic M2SDs for both compounds in the well. The methylene chloride concentration is the highest it has ever been but interpretation of this result is clouded. Interpretation of the methylene chloride is influenced by the presence of contamination in blank analyses at the laboratory and the fact that the result is an estimate that is below the detection limit for that analytical run. The last two nitrate sampling events (March, 1999 and current) suggest that the nitrate concentration is on the increase. The uranium-233/234 result was above the Tier II Action Level but below the Background M2SD. The uranium-235 (Fig. 2-51) and uranium-238 (Fig. 2-52) results were both above the Tier II Levels as well as their Background and Historic M2SDs. The uranium-235 in 07391 appears to be increasing since early 1998 and the uranium-238 since late 1997. Because the results discussed here are not reportable exceedences well 07391 will continue to be monitored on a semi-annual basis.

Performance Monitoring well 10992 from the 881 Hillside contained non-reportable nitrate, uranium-233/234 and uranium-238 in amounts above the Tier II Action Levels. The nitrate was above the Background M2SD. There are not enough data points in the 1991-1995 interval to calculate a Historic Mean and 2x Standard Deviation for well 10992 but, by inspection, the nitrate does not appear to be increasing and is within its normal range (Figure 2-47). The uranium isotopes are below their Background M2SDs. Routine monitoring will continue at well 10992.

Performance Monitoring well 12691 from the East Trenches area contained methylene chloride, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. The uranium isotopic results were well below their respective Background M2SDs. The methylene chloride result is higher than its Historic M2SD, but is tainted in the same manner as that in well 07391 (Figure 2-15). The result is an estimate that is below the detection limit for the analytical run and contamination was present in blank analytical runs at the laboratory (Table 3-2). Methylene chloride has been higher in the past. At this time, by inspection, there does not appear to be a definitive increasing trend for methylene chloride. Routine monitoring will continue at well 12691.

Performance Monitoring well 15699 from the Mound area contained seven analytes that exceeded the Tier II Action Levels. The seven analytes include 1,1-dichloroethene, 1,2-dichloroethane, cis-1,2-dichloroethene, tetrachloroethene, trichloroethene, uranium-233/234 and uranium-238. None of these results are reportable. Because this is a recent well installation no Historical M2SDs are available. Only three sampling events have occurred so far, at this time no trend plots are being shown. The uranium isotopes were both below their respective Background M2SDs. Since the beginning of the year (1999) when sampling began; the concentrations of 1,1-dichloroethene, cis-1,2-dichloroethene and trichloroethene have increased. In the same time interval the concentrations of 1,2-dichloroethane and tetrachloroethene initially increased and then subsequently slightly decreased. Routine quarterly monitoring of well 15699 will continue.

Performance Monitoring location 891COLWEL from the 881 Hillside contained non-reportable quantities of methylene chloride, tetrachloroethene, trichloroethene, selenium, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. Trend plots for methylene chloride (Figure 2-17), tetrachloroethene (Figure 2-26), trichloroethene (Figure 2-35) and selenium (Figure 2-43) suggest that these analytes do not appear to be increasing significantly. Concentrations of the volatile organic compounds are below their respective Historic M2SDs. Selenium is above the Background

13

M2SD but below its Historic M2SD. The methylene chloride result may be influenced by lab contamination, it is "JB" qualified, and the fact that it is an estimate that is below the detection limit. The uranium isotopes are both below their Background M2SDs. Routine monitoring of location 891COLWEL is planned.

Performance Monitoring location SW13494 from an 881 Hillside exhibited non-reportable results for tetrachloroethene, uranium-233/234 and uranium-238 that were above their Tier II Action Levels. The uranium results were well below their respective Background M2SDs. Since the Second Quarter 1999 Groundwater Report (RMRS, 1999c), additional data points (prior to June, 1995) have become available for this location. This report contains a more complete history of tetrachloroethene concentration in the well as illustrated in Figure 2-27. The third quarter 1999 tetrachloroethene results were high but within the normal range for the site, i.e. below the Historic M2SD. However, the tetrachloroethene trend plot may be showing an increase in concentration with time. Routine monitoring of SW13494 will continue.

Plume Definition Wells: Eight Plume Definition wells were visited in the third quarter of 1999. All eight wells had at least one analytical result above the Tier II Action Level. There were no reportable analytical results associated with these wells.

Plume Definition well 00491 exhibited non-reportable results for carbon tetrachloride (Figure 2-5), methylene chloride (Figure 2-13), tetrachloroethene (Figure 2-18), trichloroethene (Figure 2-28), uranium-233/234 and uranium-238. The results for the organic compounds are all below their Historic M2SDs. The results for the uranium isotopes are below their Background M2SDs. Well 00491 will be kept on a routine sampling schedule.

Plume Definition well 00597 contained non-reportable nitrate that exceeded the Tier II Action Level. The nitrate concentration was also above the Background M2SD (Figure 2-45). This recent well does not have a Historic M2SD. The nitrate concentration has been slowly increasing since the first sample was collected in late 1997. Well 00597 is on a routine sampling schedule.

Plume Definition well 03991 exhibited concentrations of carbon tetrachloride, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. The carbon tetrachloride in the well was below its Historic M2SD (Figure 2-6). The uranium isotopes were both below their Background M2SDs. Routine monitoring will continue at well 03991.

Plume Definition well 0487 contained carbon tetrachloride, tetrachloroethene, trichloroethene, selenium, uranium-233/234 and uranium-238 that were equal to or above the Tier II Action Levels. The carbon tetrachloride (Figure 2-7), tetrachloroethene (Figure 2-19) and trichloroethene (Figure 2-29) are well below their respective Historic M2SDs. The selenium (Figure 2-40) was above the Background M2SD but below the Historic M2SD for the well. Uranium-233/234 and uranium-238 were both below their Background M2SDs. Well 0487 will be monitored in a routine manner.

Plume Definition well 05391 contained carbon tetrachloride, tetrachloroethene, uranium-233/234 and uranium-238 that were equal to or above the Tier II Action Levels. The carbon tetrachloride (Figure 2-8) and tetrachloroethene (Figure 2-20) were both below their Historic M2SDs. The uranium isotopes were both well below their Background M2SDs. Routine monitoring is continuing at well 05391.

Plume Definition well 6286 had carbon tetrachloride, selenium, uranium-233/234 and uranium-238 that were above the Tier II Action Levels. The carbon tetrachloride was below its Historic M2SD (Figure 2-11). The selenium concentration was above the Background M2SD just barely below the Historic M2SD for selenium in the well (Table 3-2 and Figure 2-42). The uranium isotopes were

14

both well below their respective Background M2SDs. Well 6286 will continue to be monitored on a routine basis.

Plume Definition well 6386 contained uranium-233/234 and uranium-238 in amounts that were above the Tier II Action Levels but below the respective Background M2SDs. Routine monitoring will continue at well 6386.

Plume Definition well P209389 had a result for 1,1-dichloroethene that was above the Tier II Action Level. The 1,1-dichloroethene concentration is below the Historic M2SD for the well (Figure 2-3). Routine monitoring of P209389 will continue.

Plume Degradation Wells: Twelve Plume Degradation wells were visited in the third quarter of 1999. Two of these wells were dry. Eight of the remaining ten wells had non-reportable analyte occurrences that were above the Tier II Action Levels.

Plume Degradation well 18199 at IHSS 118.1 exhibited concentrations of carbon tetrachloride, chloroform, hexachloroethane, methylene chloride, tetrachloroethene and vinyl chloride that rose above the Tier II Action Levels. This is only the second sampling event associated with IHSS 118.1 and therefore no trend plots are presented here. Routine quarterly monitoring of well 18199 is continuing.

Plume Degradation well 18299 at IHSS 118.1 had carbon tetrachloride, chloroform, methylene chloride and tetrachloroethene in amounts that were above the Tier II Action Levels. This is only the second sampling event associated with IHSS 118.1 and therefore no trend plots are presented here. Routine quarterly monitoring of well 18299 is continuing.

Plume Degradation well 18399 at IHSS 118.1 exhibited concentrations of 1,1,1-trichloroethane, carbon tetrachloride, chloroform and methylene chloride above the Tier II Action Levels. This is only the second sampling event associated with IHSS 118.1 and therefore no trend plots are presented here. Routine quarterly monitoring of well 18399 is continuing.

Plume Degradation well 18499 at IHSS 118.1 had amounts of the following compounds that were above the Tier II Action Levels: carbon tetrachloride, chloroform, hexachlorobutadiene, hexachloroethane and methylene chloride. This is only the second sampling event associated with IHSS 118.1 and therefore no trend plots are presented here. Routine quarterly monitoring of well 18499 is continuing.

Plume Degradation well 18599 at IHSS 118.1 exhibited concentrations of carbon tetrachloride, chloroform and methylene chloride that were above the Tier II Action Levels. This is only the second sampling event associated with IHSS 118.1 and therefore no trend plots are presented here. Routine quarterly monitoring of well 18599 is continuing.

Plume Degradation well 18799 at IHSS 118.1 exhibited concentrations of carbon tetrachloride, chloroform, chloromethane, methylene chloride and tetrachloroethene that were above the Tier II Action Levels. This is only the second sampling event associated with IHSS 118.1 and therefore no trend plots are presented here. Routine quarterly monitoring of well 18799 is continuing.

Plume Degradation well 90099 is a new installation associated with the 903 Pad/Ryan's Pit Plume. It had quantities of carbon tetrachloride, methylene chloride, tetrachloroethene and trichloroethene that were above the Tier II Action Levels in this first round of sampling. No trend plots are available at this time. Well 90099 is on a quarterly sampling schedule.

15

Plume Degradation well 90399 is a new installation associated with the 903 Pad/Ryan's Pit Plume. It had quantities of carbon tetrachloride, tetrachloroethene and trichloroethene that were above the Tier II Action Levels in this first round of sampling. No trend plots are available at this time. Well 90399 is on a quarterly sampling schedule.

Plume Extent Wells: Twenty-one Plume extent wells were visited in the third quarter, two of these were dry. Of the nineteen Plume Extent wells sampled sixteen wells had analytes that exceeded Tier II Action Levels. From these sixteen wells five wells had a total of 10 reportable analytical results.

Plume Extent wells 05091, 10194, 22696, 23096, 6186, 7086, 75992, 76992 and P114389 all had uranium-233/234 and uranium-238 non-reportable results that were above Tier II Action Levels. Plume Extent wells 43392 and P313589 had isotopic uranium-233/234 only in non-reportable amounts above the Tier II Action Level. All the results are below the Background M2SDs, most are well below, for these isotopes. These wells will continue to be monitored on a routine schedule.

Plume Extent well 06091 had a reportable occurrence of carbon tetrachloride. This sample event represents the last of three monthly samples each of which indicate a slowly increasing amount of carbon tetrachloride in the well (Figure 2-10). This report constitutes notification of increased carbon tetrachloride at well 06091. The well will be returned to routine semi-annual monitoring.

Plume Extent well 10994 contained non-reportable quantities of uranium-233/234 and uranium-238 and a reportable result for selenium. The uranium isotopes were above Tier II Action Levels but below the Background M2SDs. The selenium concentration was above the Tier II Action Level and Background M2SD (Figure 2-41). However, selenium was below the Historic M2SD. The well will be monitored on a routine basis.

Plume Extent well 22896 had reportable amounts of methylene chloride, trichloroethene and nitrate. Each of these compounds exceeded its Tier II Action Level, trichloroethene was above even the **Tier I** Action Level. The nitrate also exceeded the Background M2SD. The methylene chloride concentration has decreased from the maximum recorded in March of 1999 (Figure 2-16). There does not appear to be a clear increasing trend for methylene chloride. (Note that the March result and the current one are both affected by blank contamination at the laboratory and the current result is an estimate that is lower than the detection limit for its sample run.) The trichloroethene analysis, while high, is among the lowest for the well and does not appear to be part of a clear increasing trend (Figure 2-32). There are only 3 nitrate analyses for well 22896, no trend plot is available. The nitrate values are 12.0 (6/96), 12.1 (3/99) and 15 (8/99) mg/l. Well 22896 will be monitored on a routine basis.

Plume Extent well 23296 contained reportable amounts of cis-1,2-dichloroethene, tetrachloroethene and trichloroethene and non-reportable amounts of uranium-233/234 and uranium-238. Results for these analytes were above Tier II Action Levels. Because these wells were installed relatively recently, Historic M2SDs for the analytes have not been calculated. By inspection: the cis-1,2-dichloroethene result is the highest recorded at this well for this compound (Figure 2-12). By inspection this result is above normal range for the well. The tetrachloroethene (Figure 2-24) and trichloroethene (Figure 2-33) appear to be within their normal ranges. The uranium isotopes are both below their respective Background M2SDs. This report constitutes notification of the high cis-1,2-dichloroethene results at well 23296. Monthly monitoring of this well for VOCs will begin as soon as possible. (A sample collected in October, 1999 contained 170 μg/l of cis-1,2-dichloroethene.)

Plume Extent well 3586 had reportable amounts of vinyl chloride and manganese and non-reportable uranium-233/234 and uranium-238. The associated results were over the Tier II Action Levels. The vinyl chloride was below its Historic M2SD (Figure 2-36). The manganese was well above the

16

Background M2SD but below its Historic M2SD (Figure 2-37). Both uranium isotopes were below their Background M2SDs. Routine monitoring of well 3586 will continue.

RCRA Monitoring Wells: Eight RCRA monitoring wells were visited in the third quarter of 1999. One well was dry. Of the seven sampled wells, two wells exhibited five reportable results.

Downgradient RCRA Monitoring well 4087 contained reportable sulfate and non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Level. The sulfate was above the Background M2SD but below the well's Historic M2SD (Figure 2-49). The uranium content was below the background M2SDs in both cases. Only routine monitoring is required.

Downgradient RCRA Monitoring well 52894 contained non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Level. The uranium content was below the background M2SD. Only routine monitoring is required.

Upgradient RCRA Monitoring well 70193 contained non-reportable amounts of uranium-233/234 and uranium-238 that were above the Tier II Action Level. The uranium content was below the background M2SD. Only routine monitoring is required.

Upgradient RCRA Monitoring well 70393 held non-reportable quantities of 1,1-dichloroethene (Figure 2-2), tetrachloroethene (Figure 2-25) and trichloroethene (Figure 2-34) that were above Tier II Action Levels. The concentrations of these compounds were below the Historic M2SDs for this well. Routine monitoring will be continued at this wellsite. Results for these compounds were erroneously listed as reportable in the Second Quarter 1999 Groundwater Report (RMRS, 1999c). Because well 70393 is upgradient they should only have been recorded as non-reportable.

Downgradient RCRA Monitoring well B206989 had reportable lithium, selenium, nitrate and uranium-235. It also had non-reportable uranium-233/234 and uranium-238. Results for all the analytes were above Tier II Action Levels. The lithium, selenium, nitrate and uranium-235 concentrations are above the Background M2SDs. The nitrate is below its Historic M2SD. Well B206989 commonly does not provide enough water for a complete sample suite. Therefore few Historic M2SDs and trend plots are available. Only three data points are available for lithium at B206989 there is no trend plot. The three samples beginning in late 1998 show an increase in lithium in the well. Four data points for selenium are available so a trend plot (Figure 2-44) is available. The selenium trend plot again shows a slight increase with time. Multiple points are available for nitrate, Figure 2-48 illustrates that nitrate is within its Historic M2SD. Only two data points are available for uranium-235 and therefore there is no trend plot. (One point is from the Fourth Quarter, 1999.) Both uranium-235 points are above the Background M2SD. The uranium-233/234 and uranium-238 are both below their Background M2SDs.

Abbreviations

TR1 = First analytical run
TR2 = Second analytical run, usually implies dilution (also DL1, DIL)
TR3 = Third analytical run, etc.

UG/L = micrograms per liter
MG/L = milligrams per liter
PCI/L = picocuries per liter

Lab Qualifiers

B = analyte present in both sample and method blank (MB) (organics)
B = detected concentration less than contract required detection limit (CRDL) but above instrument detection limit (IDL) (metals & other inorganics)
B = activity in the method blank exceeded the minimal detectable activity (MDA) (radionuclides)
D = sample run at a dilution (organics)
J = positively identified below sample quantification limit (SQL), result estimated (organics)
J = estimated quantification (inorganics & radionuclides)
U = target analyte not detected (all analytes)

Validation/Verification Qualifiers*

V/V1 = Valid
J/J1 = estimated
NJ/NJ1 = presumptively estimated
UJ/UJ1 = estimated at an elevated level of detection
R/R1 = rejected
(list in order from highest confidence to lowest)

*Validation is a more thorough review of the laboratory package than verification.

ND = Location has no historic data prior to 1995
ID = Location has insufficient data to calculate historic mean for 1991-1995

4.0 REQUIRED ACTIONS

As a consequence of the data collected during the third quarter of 1999 only Plume Extent well 23296 must be placed on a 3-month sampling schedule. This well is to be monitored for VOCs. One sample has already been collected at the time of this writing in February, 2000. The decision criteria from the IMP dictate the required actions to be taken after a reportable result. The required action for each type of well can be found in the Methods Section (Section 2.0).

Plume Extent well 06091 had a reportable occurrence of carbon tetrachloride. This sample event represents the last of three monthly samples each of which indicate a slowly increasing amount of carbon tetrachloride in the well (Figure 2-10). This report constitutes notification of increased carbon tetrachloride at well 06091. The well will be returned to routine semi-annual monitoring.

Boundary well 41591 had a reportable nickel result in 41591 was above the Tier II Action Level, the Background M2SD and Historic M2SD. This result was the second of 3 monthly sampling events. Two of the three nickel samples were above the Tier II Action Level. The well will be returned to a routine sampling schedule. This report constitutes notification of the appropriate authorities as required by the IMP.

Required Monitoring- **Completed**

Based on reporting in the 1999 First Quarter RFCA Groundwater Monitoring Report (RMRS, 1999b) the following wells have been sampled.

Manganese samples from Boundary well 0386 were collected in September, October and November 1999. Results listed in the Metals Appendix show that results were between 1.8 and 2.7 μg/l. These results suggest that the 747 μg/l result from the first quarter was in some way incorrect. Routine monitoring is planned at 0386. (Note that between the first and second quarter 1999 reports the Tier II Action Level for manganese was increased from 183 μg/l to 1720 μg/l, see Kaiser-Hill, 1999.)

Monthly nickel samples from Boundary well 41591 were collected in August, September and October 1999. Figure 2-38 shows that the latter two samples are still above the Tier II Action Level. This report constitutes notification under IMP rules that well 41591 has elevated amounts of nickel. The well will be returned to routine monitoring.

Manganese samples from Drainage well 00997 were collected in August, September and October 1999. Results are shown in Figure 2-53. The manganese concentration increased to 464 μg/l and then decreased to 269 μg/l in the three samples. Given the change in Tier II Action Level mentioned above (see discussion of well 0386) all of the results would be below the new 1720 μg/l Action Level. Routine monitoring is in progress at well 00997.

Carbon Tetrachloride samples from Plume Extent well 22696 were collected in August and October 1999. Although an attempt was made in September 1999 the well was dry. The August result was 1 μg/l and the October result was 0.2 μg/l (an estimate below the detection limit). These results are below the Tier II Action Level of 5 μg/l (Figure 2-54). These and previous results suggest that the 69 μg/l result from the first quarter was in some way erroneous. Routine monitoring will continue at well 22696.

Results in the Second Quarter 1999 Report (RMRS, 1999c) for nitrate concentrations at Plume Extent well 02197 required collection of a suite of monthly samples. The well was visited and determined to be dry on 11/18/99, technically dry (only stagnant water in the sump) on 12/6/99 and

24

technically dry on 1/3/00. These three attempts to collect a monthly sample meet the IMP requirements and no additional attempts will be made to collect nitrates. The well will continue to be sampled on a routine basis.

7.0 GROUNDWATER DATA QUALITY ASSESSMENT – GENERAL INTRODUCTION

In this section, the quality of the analytical data is assessed in terms of five data-quality parameters: **precision**, **accuracy**, **representativeness**, **completeness**, and **comparability** (**PARCC**) as outlined in an RMRS Procedure on the Evaluation of Data for Usability in Final Reports (RMRS, 1998). This section summarizes the types of data available to assess the PARCC parameters.

With respect to the 80 sites visited in the third quarter of 1999, samples were obtained at 73 of the sites with the remaining 7 sites being dry. Thirteen of the 80 sampled sites were selected for the collection of field Real/Duplicate samples. At 7 of the 80 sites field Rinsate samples were collected. On a per well basis overall frequency for field QC sampling is being maintained at 1 site in 20 (5%) over the course of this quarter's sampling program. Duplicates were collected at a ratio of 1 in 6.1 (16.25%) and rinsates at a ratio of 1 in 11.4 (8.75%). Field QC data from the third quarter are presented below.

Data used to evaluate the PARCC parameters were included in the data set compiled as described in Section 2.

Precision:

Precision is a measure of the reproducibility of analytical results. Precision is expressed quantitatively by the relative percent difference (RPD) between duplicate field samples for Volatile Organic Compounds (VOCs), Metals, and Water Quality Parameters (WQPs) as defined by the following equation:

$$RPD = \frac{|(S-D)|}{(S+D)/2} \times 100$$

where: S = Concentration of analyte in Real Sample
D = Concentration of analyte in Duplicate Sample

With respect to Radionuclides the RFETS Groundwater Program uses the following "Duplicate Error Ratio" equation:

$$DER = \frac{|S-D|}{\sqrt{(TPU_S^2 + TPU_D^2)}}$$

where TPU_S = Total Propagated Uncertainty of the Sample
TPU_D = Total Propagated Uncertainty of the Duplicate or Lab Replicate
S = Sample Result
D = Duplicate or Lab Replicate Result

Because TPU is seldom reported (except possibly for Tritium-H3 analyses) in the laboratory data records, 2-Sigma Error has been substituted for TPU in the Uranium and Americium/Plutonium calculations made for this report

Individual RPDs/DERs can be found in Table 7-1. The QC criterion for RPDs is ≤30%, for DERs the criterion is ≤1.96. Table 7-2 gives a summary of the Overall Precision Compliance for RPDs and DERs.

Accuracy:

Accuracy is a measure of how closely an analytical result corresponds to the "true" concentration in a sample. Table 7-3 gives the contract-required detection limits (RDLs) for the various analytes.

The third quarter 1999 determination of accuracy has been simplified by the presence of a complete data set derived from the SWD database. With respect to analytical results retrieved from electronic files, detection limits are readily available.

New information for the third quarter (1999) are Table 7-4 Matrix Spike Recovery for VOC-Metal-WQP Samples and Table 7-5 Lab-Control-Sample Recovery for Radionuclides. Acceptable criteria for matrix spikes and lab control samples is between 80 and 120 percent recovery. These tables will give additional information on the accuracy of analyses by the laboratories. The tables will continue to be made available in future quarterly reports.

Representativeness:

The discussion of representativeness in this section is limited to an evaluation of whether analytical results for field samples are truly representative of environmental concentrations or whether they may have been influenced by the introduction of contamination during collection and handling. The potential introduction of contamination is evaluated by examination of the analytical results for equipment rinsates (Table 7-6). Equipment rinsates are used to assess the efficacy of the decontamination process and possible cross-contamination between environmental samples. They are samples of volatile free "distilled" water that have been poured over or through decontaminated sampling equipment and subsequently handled in the same manner as environmental samples.

Although rinsates are used specifically as indicators of cross-contamination during decontamination of equipment, they are carried through the entire sampling, shipping, and laboratory process and are, consequently, also good indicators of potential contamination introduced during any of these steps. Trip blanks are not used by the groundwater program because the rinsate samples are judged to be adequate to assess introduced contamination.

Other aspects of representativeness such as numbers of samples and spatial distribution are fixed in the Groundwater Integrated Monitoring Plan (DOE, 1998). As determined by the IMP, all required wells for this quarter were visited. See Figure 1 for reference to the spatial distribution of the samples.

Completeness:

All samples specified in the IMP were collected unless well disposition was prohibitive (i.e. dry or went dry during sampling). Table 3-1 presents a summary of sample collection and well disposition. Table 7-7 compares the Actual Number of Samples taken in the third quarter to the Required Number of Samples. The completeness goal of 90% was met in 2 of 19 analyte groups (see below). All required wells were visited (some more than once) and all analytical results for the third quarter had been received prior to the writing of this report.

Completeness as a quantitative measure of data quality may be expressed as the percentage of valid or acceptable data obtained from a measurement system. For the third quarter 99.8% of the analytical records have either been Validated or Verified. Where available, validation data for each sample are listed in Appendix A. Table 7-8 summarizes the validation completeness based on the following formula:

Dp_u = Percentage of usable data points
DP_t = Total number of data points
DP_n = Non-usable data points

$$\text{Completeness} = Dp_u = \frac{DP_t - DP_n}{DP_t} \times 100 \text{ (in percent)}$$

The completeness criterion is $\geq 90\%$.

48

Comparability:

During the third quarter of 1999 planned analytical methods for VOCs, WQPs, and Radionuclides remained consistent over the sampling period (see below for metals). Table 7-3 lists the required methods for the various analytes. Laboratory analyses were performed according to standard CLP protocols and results should be comparable to data produced by similar methods.

In the third quarter of 1998 the sampling procedure was modified in order to reduce the amount of purge water generated at certain wells and also enhance the quality of the samples collected. This practice has continued into the third quarter of 1999.

Some wells with adequate recharge rates had dedicated bladder pumps installed. Pump equipped wells provide an opportunity for "micropurging" at the time of sampling. Micropurging has several advantages. Less water is needed to purge the pump system compared to purging the entire well with a bailer. Thus there is less purge water to dispose of. Micropurge sample collection provides a method of minimizing increased colloid mobilization by removing water from the well at the screen interval at a rate that preserves or minimally disrupts steady-state flow conditions in the aquifer. During micropurge sampling, groundwater is discharged from the aquifer at a rate that the aquifer will yield without creating a cone of depression around the discharge well. Research indicates that colloid mobilization will not increase above steady-state conditions during low-flow discharge. Therefore, the collected sample is more likely to represent steady-state groundwater chemistry.

The installation of bladder pumps and micropurging without sample filtration resulted in a change in analytical method for metals. Pump equipped wells are sampled and analyzed for total metals because no filter is used during sample collection. Analyses of this type correspond to line item code SS05C001 and analytical method CLP-SOW-Total. Bailed well samples are analyzed for dissolved metals using line item code SS05C007 and analytical method CLP-SOW-Dissolved. (The two line item codes mentioned here were changed from SS05B001 and SS05B007 during the third quarter, records with either listing are acceptable.)

DISCUSSION OF ANALYTE GROUPS

7.1 METALS

Precision:

There were 243 records for paired duplicate samples versus 1624 real sample records in the data set for metals in the third quarter, 1999 (14.96%, 1 in 6.7). Of the 242 real/duplicate pairs there were 167 records in which a Relative Percent Difference (RPD) could be calculated (Table 7-1). Of the 167 metal RPDs 144 were within the QC criterion of ≤30% for water (Table 7-2). Twenty-three RPD pairs for were outside the 30% criterion. With 86% of the RPDs meeting the QC criterion, overall precision for dissolved metal analysis is just above the acceptable goal of 85%.

Of the 23 real/duplicate pairs that do not meet the acceptable 30% RPD criterion eight pairs both have "UJ"/"UJ1" validation qualifiers and two pairs have "J"/"J1" validation qualifiers (these qualifiers signify that some level of estimation is present in the result). Another 17 real/duplicate pairs have a combination of a "B" laboratory qualifier for both members of the pair. These combinations of lab qualifiers and validation qualifiers imply that the results used to calculate the RPDs are estimates or are at least may be difficult to replicate. Also, among the metal analytes that exceeded the 30% RPD QC criterion are aluminum, cadmium, chromium, cobalt, copper, iron, and zinc. These metals do not generally appear as contaminants of concern in RFETS wells.

The recommended frequency for duplicate samples is 1 in 20 on a per sample basis (see above). In the third quarter, 9 of 57 wells were analyzed for metals as Real/Duplicate pairs, a ratio of 1 in 6.3. Thus the Duplicate sampling frequency was well within the requirements for the third quarter on both a per well and per sample basis.

Accuracy:

Detection limits for silver and thallium were exceeded as follows. One laboratory did all the analyses. Note that results are within the Practical Quantitation Limits (PQLs) set by the IMP (Kaiser-Hill, 1999). All other metals analyses are within Contract Required Detection Limits (CRDLs) for metal analyses (Table 7-3).

For the following RINs:

99D0046	99D8809	99D9395
99D0121	99D8961	99D9396
99D0325	99D9020	99D9488

For Both Total and Dissolved Metal Analyses

Silver	reported detection limit = 0.25 μg/L	CRDL = 0.1 μg/L	PQL = 5 μg/L
Thallium	reported detection limit = 1.3 μg/L	CRDL = 0.5 μg/L	PQL = 12 μg/L

All metal analyses were performed using the proper contract required methods in the third quarter of 1999 (Table 7-3). With respect to methods the results for the third quarter are accurate.

Table 7-4 gives matrix spike recoveries for metals based on the electronic information submitted with RINs collected in the third quarter. The results in Table 7-4 show that 11 of 81 (13.6%) matrix spikes were outside the matrix spike criterion of 80-120% including aluminum, calcium, iron, lithium, magnesium, potassium and sodium.

50

Representativeness:

There were 108 rinsate records versus 1867 real/duplicate sample records for metals from the third quarter 1999 (1 in 17.3) (Table 7-6). One hundred and seven (99.1%) of the metal rinsate results were lab qualified as either "U" (non-detection) or "B" (detection was less than Contract Required Detection Limit but greater than Instrument Detection Limit) indicating that in general no metal contamination was introduced during sampling and/or shipping activities. The sole (lab) unqualified result is for aluminum whose validation qualifier ("UJ1") signifies the value is an estimate.

Completeness:

Table 7-7 indicates that 64 wells were to have been sampled for metals in the third quarter 1999. Dry wells or wells that went dry during sampling resulted in the collection of 57 actual samples, a success ratio of about 89.1%. The goal, groundwater conditions permitting, is to have greater or equal to 90% successful sampling.

Validation/Verification completeness is summarized in Table 7-8. The validation process is complete with respect to metals, all 1970 results were validated (100%). Of the 1970 metal analyses that were validated or verified in the third quarter 100% of the dissolved and total metal analyses are usable. Metal analyses for the third quarter are therefore considered to be complete with respect to validation and verification.

Comparability:

As stated in Section 2 no changes were made to analytical procedures in the third quarter of 1999. Thus analyses from the third quarter are assumed to be comparable to previous analyses.

7.2 RADIONUCLIDES

Precision:

The data set for dissolved radionuclides contains 46 duplicate records versus 273 real records (1 in 5.9, 16.8%). A Duplicate Error Ratio (DER) could be calculated for 24 of the 46 paired real to duplicate records (Table 7-1). Twenty-two of the 24 DER values (92%) are below the 1.96 criterion (Table 7-2) therefore precision is acceptable for third quarter radionuclide data.

Accuracy:

Required detection limits for the 319 radionuclide analyses performed in the third quarter 1999 are given in Table 7-3. All radionuclide analyses performed in the third quarter met the contract required detection limits. In general, the accuracy of radionuclide analyses appears to be good.

All radionuclide analyses were performed using the proper contract required methods in the third quarter of 1999 (Table 7-3). With respect to methods the results for the second quarter are accurate.

Table 7-5 gives the Laboratory Control Sample Recoveries for radionuclides collected in the third quarter. For the 84 records in Table 7-5 there are 29 that contain recoveries that appear to be outside a range of 80-120%. Note that reporting is inconsistent. The results are presumably given as a fraction of 1 indicating a percent. Most results are presented in this manner, some (see strontium$_{89/90}$) appear to have been converted to a percent by multiplying by 100. Eight additional samples, for tritium, had no entry for a percent recovery entered in their electronic files although the analysis appears to have been made.

Representativeness:

There were 19 records from 4 rinsate locations for radionuclides collected in the third quarter (Table 7-6). This represents a ratio of 1 in 16.8 with respect to the 319 records for real and duplicate analyses.

Except for 2 of the 19 rinsate results, all analyses were below Tier II Action Levels and were designated as "U" by the laboratories. The 2 exceptions consisted of "J" qualified (i.e. estimates) americium-241 results that were verified as V1s and are well below the Tier II Action Level. All radionuclide rinsate results were validated, all results are valid data points. There is little indication of introduced radionuclide contamination during sampling activities in the third quarter of 1999.

Completeness:

Table 7-7 indicates that 42-plutonium/americium, 67-uranium isotope, 19-tritium, 10-strontium$_{89/90}$ and 6-cesium$_{137}$ samples were to have been collected for analyses. The success ratio for the required samples varies due to dry wells or wells that went dry during sampling: plutonium/americium-83.3%, uranium isotope-88.1%, tritium-84.2%, strontium$_{89/90}$-90.0% and cesium$_{137}$-33.3%. Due to dry wells the completeness goal of 90% was met only in the case of strontium$_{89/90}$.

Except for 4 cesium$_{137}$ analyses, which are done by task order (a special arrangement with the laboratory and where no validation procedure has been defined), all radionuclide results have been validated and provide usable data points (Table 7-8). Radionuclide analyses are judged to be complete with respect to validation and verification.

Comparability

No changes were made to analytical procedures in the second quarter of 1999. Thus the radionuclide analyses presented here are assumed to be comparable to previous analyses.

7.3 VOLATILE AND SEMI-VOLATILE ORGANIC COMPOUNDS plus Methane

Precision:

There were 863 duplicate records versus 4878 real records for volatile and semi-volatile organic compounds and methane in the third quarter (1 in 5.7 samples, 17.7%). Of the 863 real/duplicate pairs a relative percent difference (RPD) could be calculated for 32 pairs (Table 7-1). Of the 32 paired RPDs only 25 were below the 30% criterion (78 %) (Table 7-2). Five of the seven RPDs not meeting the criterion are from one well, 70393. Significant differences between the real and duplicate samples for well 70393 cannot be explained by examination of either the lab qualifier or validation/verification qualifier. Trend plots suggest that real results for 1-1-dichloroethene (Figure 2-2), tetrachloroethene (Figure 2-25) and trichloroethene (Figure 2-34) are low with respect to the more reasonable duplicate results. One of the remaining RPD results is for methylene chloride from well 5887. The lab and validation/verification qualifiers do not support lab contamination in this case. The last RPD is from well 90299 for trichloroethene and again the qualifiers do not help explain the result. With a goal of 85% meeting the 30% RPD criterion analyses of volatile and semi-volatile organic compounds for the third quarter of 1999 could be more precise.

Accuracy:

Required detection limits for VOC analyses are given in Table 7-3. The Contract Required Detection Limits (CRDLs) were met in the third quarter except in the following cases. In the cases where a

52

whole RIN is cited the detection limit reported by the laboratory causes all contract required detection limits to be exceeded for the whole analytical run.

VOCs by SW-846 Method 8260
(most compounds have CRDL of 5 µg/l, 2 compounds have 50 µg/l and 2 have 100 µg/l CRDLs)
Well 18199 (real-TR1) RIN 99D0269 run at 25x dilution, detection limit 25 µg/l, 61 analyses
Well 18299 (real-TR1) RIN 99D0269 run at 25x dilution, detection limit 25 µg/l, 63 analyses
Well 18399 (real-TR1) RIN 99D0269 run at 25x dilution, detection limit 25 µg/l, 63 analyses
Well 18499 (real-TR1) RIN 99D0348 run at 100x dilution, detection limit 100 µg/l, 62 analyses
Well 18499 (dup-TR1) RIN 99D0348 run at 100x dilution, detection limit 100 µg/l, 62 analyses
Well 18599 (real-TR1) RIN 99D0348 run at 40x dilution, detection limit 40 µg/l, 62 analyses
Well 18799 (real-TR1) RIN 99D0348 run at 5x dilution (which is acceptable),
but detection limit is given as 25 µg/l which is unacceptable, 61 analyses

VOCs by EPA 524.2 Method (all compounds have 1 µg/l CRDL)
Well 00491 (real-TR1) RIN 99D9394 run at 20x dilution, detection limit 20 µg/l, 57 analyses
Well 07391 (real-TR1) RIN 99D0045 run at 5000x dilution, detection limit 5000 µg/l, 57 analyses
Well 12691 (real-TR1) RIN 99D8961 run at 50x dilution, detection limit 50 µg/l, 57 analyses
Well 22896 (real-TR1) RIN 99D0045 run at 100x dilution, detection limit 100 µg/l, 57 analyses
Location 891COLWEL (real-TR1) RIN 99D0045 analysis run at50x dilution,
detection limit 50 µg/l, 57 analyses
Well 90099 (real-TR1) RIN 99D9332 run at 20x dilution, detection limit 20 µg/l, 57 analyses
Well 90399 (real-TR1) RIN 99D9332 analysis run at 20x dilution 57 analyses
Location SW13494 (real-TR2) RIN 99D9354 run at 2x dilution, detection limit 2 µg/l, 57 analyses
A TR1 analysis suite was not reported for this location.

In RIN 99D0120 the detection limit was not met for 1,2-dibromo-3-chloropropane in the following wells; 4087, 38591, 10394, 40199 real, 40199 dup, 40199 rinse, 40299 real, 40299 dup and 40299 rinse. For the same RIN the detection limit for dibromochloromethane at well 40299 was not met.

Semi-VOC by SW-846 Method 8270
In the following RINs and wells the detection limit for 2,4,5-trichlorophenol and 2,4-dichlorophenol were not met;
RIN 99D0269 wells 18199, 18299, 18399
RIN 99D0348 wells 18499 real, 18499 dup, 18599, 18699, 18799

Thus 908 analyses of the 6146 real-dup-rinse analyses requested (14.7%) did not meet the CRDL requirement.

Table 7-4 gives the matrix spike results for VOCs and SVOCs. The acceptable matrix spike criterion is to have the recovery be between 80% and 120% (inclusive). With respect to matrix spikes for VOCs, 146 entries out of 822 given as a percent are outside the range of 80-120%. With respect to SVOCs with 126 entries en toto, 10 entries are given as a percent and are within the 80-120% range. The remaining SVOC entries are reported in terms of µg/l. Of these 116 entries, 100 are "U" lab qualified at a detection limit of 120 µg/l and another six are "U" qualified at 250 µg/l. This leaves eight SVOC spikes that are not "U" qualified at 120 µg/l and two at 250 µg/l.

All VOC analyses were performed using the proper contract required methods in the third quarter of 1999 (Table 7-3). With respect to methods the results for the third quarter are accurate.

53

Representativeness:

There were 406 rinsate records from seven wells for Volatile and Semi-volatile Organic Compounds (VOCs and SVOCs) for the third quarter of 1999 (Table 7-6). This represents a ratio of 1 in 14.1 (7.0%) with respect to the 5740 real/duplicate analyses

All rinsate analyses were at or below detection limits as non-detects ("U") or estimates ("J" lab qualified) except for 2 cases. Chloromethane from well 05091 has a "V" validated result of 6.55 μg/l. Results chloromethane from the real and duplicate analyses in well 05091 are qualified "U" at the 1 μg/l detection limit with "V" validations. Therefore the rinsate result in this case appears to be due to laboratory contamination.

The second rinsate result is for tetrachloroethene from well 10498. Here the real and duplicate have measurable amounts of tetrachloroethene indicating that contamination in this case might be possible. Overall however, there does not seem to be significant indication of introduced VOC contamination for the sampling period. The VOC samples are judged to be representative.

Completeness:

Table 7-7 shows that 80 wells were to have been sampled for VOCs and eight wells for SVOCs within the third quarter, 1999. Because of dry wells only 73 VOC and 7 SVOC samples could actually be collected. That translates to a success ratio of 91.3% for VOCs and 87.5% for SVOCs just under the goal of 90.0%. Sampling for VOCs in the third quarter are judged to be complete because all wells were visited as specified by the IMP.

All VOC and samples collected in the third quarter of 1999 were validated on the assumption that the holding time for unpreserved VOC vials is 7 days. The RFETS groundwater program uses a 14-day hold time based on recent CDPHE guidance (CDPHE, 1998). Because of the 7-day hold time criteria, sample results may have received an erroneous "J" or "J1"validation qualifier if no other factors affected the analyses.

All VOC samples for the third quarter of 1999 were validated or verified (Table 7-8). All VOC results (4813) except for 10 are useable data points (99.8%). Similarly, all SVOC samples were validated or verified. All SVOC results (824) except for 8 are usable (99.0%). From the standpoint of validation qualification as it pertains to accuracy, VOC and SVOC results from this quarter are good.

Comparability:

As stated above no changes were made to analytical procedures in the second quarter of 1999. Thus the VOC analyses presented here are assumed to be comparable to previous analyses.

Methane

Seven of eight methane samples were successfully collected during the third quarter 1999. One well was dry (Table 7-7). This data was not provided as an electronic file. One RPD for methane could be calculated based on one real/duplicate pair, the value of the RPD is 10.5% (Table 7-1). Because methane analyses are done by project specific task order there is no contract required detection limit and no validations are made. The laboratory detection limit was 1 μg/l. The laboratory ran 2 fortified blanks, recovery in both cases was 105%. A laboratory duplicate had an RPD of 8.7%. Method blanks run by the lab were clean. The methane analyses performed during the third quarter are acceptable.

7.4 WATER QUALITY PARAMETERS

Precision:

There were 39 duplicate sample records versus 192 real sample records for collected Water Quality Parameters (WQPs) during the third quarter (1 in 4.9). Of the 39 real/duplicate pairs, 35 could be used to generate Relative Percent Difference (RPD) values (Table 7-1). Thirty-four of the values (97%) were within the QC criterion of ≤30% (Table 7-2). These results indicate good precision for water quality parameter analyses.

Accuracy:

Electronic data indicate that the contract required detection limits were met for all WQP analyses (Table 7-3).

All WQP analyses were performed using the proper contract required methods in the third quarter of 1999 (Table 7-3). With respect to methods the results for the second quarter are accurate.

Table 7-4 gives the matrix spike results for WQPs for the third quarter 0f 1999. All 40 results are within the acceptable 80-120% recovery range. Analytical results for water quality parameters are judged to be accurate for the third quarter of 1999.

Representativeness:

There were 13 equipment rinsate results from six different wells for water quality parameters in the third quarter (Table 7-6). This represents a ratio of 1 in 17.8 with respect to the 231 real/duplicate analyses.

Seven of the 13 rinse analyses were non-detects ("U") by the laboratories (53.8%). The remaining four results were not qualified by the lab and had either "V" or "V1" validations. Two of the rinsate detections were for small amounts of nitrate and two for small amounts of total dissolved solids. With respect to Water Quality Parameters for the third quarter it appears that there is little indication of significant introduced contamination.

Completeness:

Table 7-7 indicates that for Water Quality Parameters several new analyte categories have been added. Sampling completeness is highly variable for Water Quality Parameters and due to the availability of water at each well. Success ranged from 88.2% sampled for nitrate (68 wells to be sampled) and fluoride (17 wells to be sampled) to 0% for PCB's (only two wells to be sampled). The completeness goal of 90% was not met for any of the analytes due to dry wells or insufficient water.

All of the Water Quality Parameter samples collected this quarter (100%) gave usable results with respect to validation/verification (Table7-8). Therefore, the third quarter is complete with respect to this criterion.

Comparability:

As stated above no changes were made to analytical procedures in the third quarter of 1999. Thus the WQP analyses presented here are assumed to be comparable to previous analyses.

55

Table 7-2
Summary of RPD and DER Results
Groundwater Third Quarter, 1999

Sample Group	QC Criterion for RPD or DER Value	Original Number of Available Real/Dup Pairs	Number of RPDs/DERs Calculated	Number of RPDs/DERs Within Criteria	Overall Precision Compliance (Goal = 85%)
Radionuclides	less than 1.96	46	24	22	92%
Organic Compounds + CH_4	less than 30%	863	32	25	78%
Metals	less than 30%	243	167	144	86%
Water Quality Parameters	less than 30%	39	35	34	97%

Based on 1190 original Real-Duplicate pairs, not counting TR2, TR3, etc. runs.

Calculation Criteria	Lab Qualifier = "U"		Lab Qualifier = "B"		Lab Qualifier = "J"	
	Meaning	Action	Meaning	Action	Meaning	Action
Radionuclides	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Activity in the method blank exceeded the minimal detectable activity (MDA).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.
Organics	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Analyte in both sample and associated method blank.	Calculation made.	Result is estimate.	Calculation not made for "J" or "JB" data when result is less than CRDL.
Metals	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Result detected was less than contract required detection limit (CRDL) but greater than the instrument detection limit (IDL).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.
Water Quality Parameters	Non-detect	Calculation made unless **both** real and dup are "U" qualified.	Result detected was less than contract required detection limit (CRDL) but greater than the instrument detection limit (IDL).	Calculation made.	Result is estimate.	Calculation not made for "J" data when result is less than CRDL.

Table 7-7
RFCA Groundwater Monitoring Sample Comparison:
Required versus Actual Third Quarter, 1999

Sample Types		Required Number of Visits	Actual Number of Visits*	Actual Number of Samples Collected	Deviation	Success Ratio; % Samples Collected (or Wells Visited)	Discrepancy Justification
Groundwater Wells (Visits)		80	80	NA	0	100.0	NA
VOC's		80	80	73	7	91.3	Dry
Semi-VOC's		8	8	7	1	87.5	Dry
Methane		8	8	7	1	87.5	Dry
Metals		64	64	57	7	89.1	Dry or Insw
Radionuclides							
	Pu/Am	42	42	35	7	83.3	Dry or Insw
	U-isotope	67	67	59	8	88.1	Dry or Insw
	Tritium	19	19	16	3	84.2	Dry or Insw
	Strontium	10	10	9	1	90.0	Dry
	Cesium	6	6	2	4	33.3	Insw
Water Quality Parameters							
	Nitrate	68	68	60	8	88.2	Dry or Insw
	TDS	61	61	51	10	83.6	Dry or Insw
	Sulfate	40	40	34	6	85.0	Dry or Insw
	Fluoride	17	17	15	2	88.2	Dry or Insw
	TOC	8	8	7	1	87.5	Dry
	DOC	8	8	7	1	87.5	Dry
	PCB's	2	2	0	2	0.0	Insw
	Sulfide as H_2S	8	8	7	1	87.5	Dry
	Chloride	8	8	7	1	87.5	Dry
	Cyanide	8	8	6	2	75.0	Insw
Totals		532	532	459	73	86.3	Dry or Insw

*Does not reflect multiple visits to dry wells.
Dry = Well did not recharge after purging. No samples collected.
Insw = Insufficient water to complete sample suite.

74

Table 7-8
Summary of Validation / Verification Completeness
Third Quarter, 1999

		Usable Data Points - Dp_u	Non-usable Data Points - DP_n	Total Data Points - DP_t	Percent of Usable Data Points	No Validation / Verification
VOC's		4803	10	4813	99.8%	0
Semi-VOC's		816	8	824	99.0%	0
Methane						8
Metals		1970	0	1970	100.0%	0
Radionuclides						
	Pu / Am	88	0	88	100.0%	0
	U-isotope	219	0	219	100.0%	0
	Tritium	23	0	23	100.0%	0
	Strontium	11	0	11	100.0%	0
	Cesium					4
Water Quality Parameters						
	Nitrate	75	0	75	100.0%	0
	TDS	64	0	64	100.0%	0
	Sulfate	42	0	42	100.0%	0
	Fluoride	22	0	22	100.0%	0
	TOC	5	0	5	100.0%	0
	DOC	5	0	5	100.0%	0
	Sulfide as H_2S	8	0	8	100.0%	0
	Chloride	8	0	8	100.0%	0
	Cyanide	12	0	12	100.0%	0
Grand Totals		8171	18	8189	99.8%	12

Usable data points include the following Validation/Verification qualifiers: J/J1, JB/JB1, U/U1, UJ/UJ1, V/V1.
Non-usable data points include the following Validation/Verification qualifiers: R/R1.

Because Cesium and Methane analyses are set up via special contracts they are not being validated at this time.

With respect to TR1-DL1 or TR1-TR2 analytical series, only one Result from a pair (with a validation qualifier) is counted here.

Completeness = $Dp_u = \frac{DP_t - DP_n}{DP_t} \times 100$ (in percent)

The acceptable QC criterion is **>90%.**

95

Figure 1

Regulatory Required Groundwater Monitoring Wells

Selected VOC & Nitrate Plumes Third Quarter, 1999 Reportable Sample Analyses

EXPLANATION

- IMP Wells Not Sampled This Quarter
- IMP Wells Sampled/Visited This Quarter
- IMP Wells With Reportable Tier II Sample Analyses
- Composite VOC Groundwater Plume (100 X MCL)
- Composite VOC Groundwater Plume (concentration equal to MCL)
- 100 x Nitrate Standard (1000 mg/l)
- Nitrate Standard (10 mg/l)

Standard Map Features

- Buildings and other structures
- Solar Evaporation Ponds (SEP)
- Lakes and ponds
- Streams, ditches, or other drainage features
- Fences and other barriers
- Rocky Flats boundary
- Paved roads
- Dirt roads

DATA SOURCE:
Buildings, fences, hydrography, roads and other structures from 1994 aerial fly-over data captured by EG&G RSL, Las Vegas. Digitized from the orthophotographs. 1/95

Scale = 1 : 14020
1 inch represents approximately 1168 feet

250 0 500 1000ft

State Plane Coordinate Projection
Colorado Central Zone
