1 Introduction

This quarterly report presents the fourth quarter, October 1 through December 31, 2008, operational and environmental monitoring results for Noble Energy Inc. (Noble), EnCana Oil & Gas (USA) Inc. (EnCana), and Williams Production RMT (Williams) natural gas drilling, completion, and production operations within a three-mile radius of the former Project Rulison site near Rulison, Colorado. Monitoring activities for the fourth quarter included the following:

- Baseline sampling of Noble Tier II gas well Battlement Mesa (BM) Chevron 34-4 in monitoring sector 9;
- Sampling drilling fluids (i.e., drilling mud) prior to and at the completion of drilling at Noble Tier I gas well BM 26-33B in monitoring sector 10, and Noble Tier I gas wells BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, BM 26-34C and BM 26-34D in monitoring sector 9;
- Ambient dosimetry and real-time radiation monitoring during drilling of Noble Tier I gas wells BM 26-33B, BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, BM 26-34C (dosimetry only), and BM 26-34D on the 26N pad in monitoring sectors 9 and 10;
- Sampling and analysis of drill cuttings from the Williams Fork Formation interval in Noble's Tier I gas wells BM 26-33B, BM 26-33D, and BM 26-34A in monitoring sectors 9 and 10;
- First gas delivery sampling and analysis of produced water and natural gas at Noble Tier I and II producing gas wells BM 36-13B and BM 36-13D in monitoring sector 7; Noble Tier II producing gas wells BM34-11A, BM34-12B, and BM34-21A in monitoring sector 9; Williams Tier II producing gas wells SP 22-13 and SP 531-13 in monitoring sector 1; and Williams Tier II producing gas well SP411-13 in monitoring sector 12;
- Quarterly sampling of natural gas and produced water at Noble Tier I producing gas well BM 35-32A;
- Conditions of Approval (COA) sampling and analysis of drill cuttings and fluids at EnCana's Tier II Federal 21-10, Federal 21-10BB, and Federal 21-15BB gas wells in monitoring sector 10, and fracing and flowback water sampling at EnCana's Tier II Federal Hagen 15-13BB gas well in monitoring sector 11; and

- COA sampling and analysis of drill cuttings at Noble's 26N pad in monitoring sector 9 and fracing water and comingled flowback water at the Noble's 34C and 36L pads in monitoring sector 9.

Sampling and analysis was performed in accordance with the Rulison Sampling and Analysis (RSAP) Revision 2 dated March 31, 2008 (URS 2008).

2 Tier I Monitoring

2.1 *Tier I Drilling Monitoring*

2.1.1 *Background Radiation Surveys*

No background radiation surveys were performed during the fourth quarter 2008. Drilling continued on the 26N pad which was previously surveyed during the second quarter 2008.

2.1.2 *Dosimetry*

Ambient radiation monitoring was performed using Landauer X-9 thermoluminescent environmental dosimeters deployed in personnel work areas to measure cumulative ambient radiation intensities while drilling Tier I wells on Noble's 26N pad. Passive radiation dosimeters were placed at five locations on the well pad [i.e., drilling control room (i.e., "dog house"), company man's trailer, directional trailer, tool pusher's trailer, and the shaker tables] and at one background location (at the intersection of High Mesa Road and the 35C pad road) on September 10, 2008 prior to drilling Noble Tier I gas well BM 26-33D. The dosimeters remained at the 26N pad until drilling was completed at Noble Tier I gas well BM 26-34C on January 9, 2009. The exposed dosimeters were sent to Landauer Inc. in Glenwood, Illinois for analysis and reporting.

2.1.3 *Real-Time Tritium Monitoring*

Real-time tritium monitoring was performed during drilling of Noble's Tier I gas wells BM 26-33B, BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, and BM 26-34D between September 5, 2008 and December 27, 2008. Real-time tritium monitoring was performed using a Canberra Model TAM 100D Tritium Monitor that was mounted on the drilling fluid and cuttings return outfall (i.e., "possum belly"), the first point where these materials are brought up from the subsurface. Tritium monitor measurements were logged 24 hours a day, 7 days a week (24/7) during drilling on a personal computer (PC). The real-time tritium monitoring results are discussed in Section 5.2.

2.1.4 *Real-Time Gamma Radiation Monitoring*

Real-time gamma radiation monitoring was performed during drilling of Noble's Tier I gas wells BM 26-33B, BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, and BM 26-34D between September 5, 2008 and December 27, 2008. Real-time gamma radiation monitoring was performed using a Ludlum Model 375 Area Monitor equipped with a Model 44-10 2 inch x 2 inch sodium iodide [NaI(Tl)] gamma scintillator, Ludlum Model 375 Area Monitor equipped

with a Model 375-336 168 cubic inch (in^3) plastic scintillation detector, and a Berkley Nucleonics Corporation (BNC) 1035 AreaSAM gamma spectrometer equipped with a 3" x 3" NaI(Tl) gamma scintillator. The gamma radiation monitors were also mounted on the drilling fluid and cuttings return outfall (i.e., "possum belly"). The gamma radiation monitors were logged 24/7 during drilling on a PC. The real-time gamma radiation monitoring results are discussed in Section 5.3.

2.1.5 Drilling Fluid Sampling and Analysis

Grab samples of drilling fluid (i.e., drilling mud) were collected prior to and, although not required under the RSAP, at the completion of drilling at Noble's Tier I gas wells BM 26-33B, BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, BM 26-34C, and BM 26-34D on the 26N pad. A grab sample was collected from the mud tanks using a pre-cleaned, disposal bailer. Sample aliquots were placed directly in the appropriately preserved laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler.

The iced sample coolers were shipped by overnight carrier to the analytical laboratories for analysis of the radiological analytes listed in Table 3 of the RSAP (URS 2008). The analytical laboratories used included GEL Laboratories LLC in Charleston, South Carolina (for radionuclides other than tritium [${}^3\text{H}$]) and Isotech Laboratories, Inc. in Champaign, Illinois (for ${}^3\text{H}$).

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Table 2. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

2.1.6 Williams Fork Formation Drill Cuttings Sampling and Analysis

Two composite samples and one field duplicate of drill cuttings were obtained from the Williams Fork Formation interval in Noble's Tier I gas wells BM 26-33B, BM 26-33D, and BM 26-34A. The cuttings collected represent depth intervals (corrected for dip and distance) that are approximately equivalent to the Project Rulison test interval. The cuttings were collected at approximately 50-foot intervals to create a 500-foot composite sample at the depth intervals shown in Table 1. Ten (10) sample aliquots from each depth interval were placed directly in a clean 5-gallon bucket and composited to create each sample. Composite sample aliquots were placed in the laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler.

The iced sample coolers were shipped by overnight carrier to the analytical laboratories for analysis of the radiological analytes listed in Table 3 of the RSAP (URS 2008). The analytical laboratory used included GEL Laboratories LLC in Charleston, South Carolina.

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Table 2. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

Table 1. Summary of Composite Drill Cutting Samples in Williams Fork Formation.

Well Number	Sample Number	Sample Date	Composite Sample Depth Interval (feet below ground surface)
BM 26-34A	BM26-34A-DC-CPTF-01	10/08/2008	8,325 – 8,825
BM 26-34A	BM26-34A-DC-CPTF-02	10/09/2008	8,825 – 9,325
BM 26-34A	BM26-34A-DC-CPTF-03	10/09/2008	8,825 – 9,325
BM 26-33B	BM26-33B-DC-CPTF-01	10/21/2008	8,475 – 8,975
BM 26-33B	BM26-33B-DC-CPTF-02	10/21/2008	8,975 – 9,475
BM 26-33B	BM26-33B-DC-CPTF-03	10/21/2008	8,975 – 9,475
BM 26-33D	BM26-33D-DC-CPTF-01	10/31/2008	8,475 – 8,975
BM 26-33D	BM26-33D-DC-CPTF-02	10/31/2008	8,975 – 9,475
BM 26-33D	BM26-33D-DC-CPTF-03	10/31/2008	8,975 – 9,475

2.1.7 Gamma-Ray Log Review

Open- or cased-hole gamma-ray logs through the Williams Fork Formation interval in Tier I gas wells were reviewed to determine whether any evidence of Project Rulison-related gamma radiation was encountered in the borehole.

2.2 *Tier I Completion Monitoring*

Noble's Tier I gas well BM 36-13B was completed during the fourth quarter 2008. Fracing fluids were sampled prior to fracing and flowback fluids were sampled following fracing. These fluids were sampled to fulfill the RSAP requirements for analysis of fracing or flowback fluids introduced to or removed from a well during completion. These fluids were sampled and analyzed in accordance with the RSAP (URS 2008).

Composite samples of fracing fluids were collected on October 16, October 24, and November 7, 2008 prior to their use. Composite samples of comingled flowback fluids from Noble gas wells BM 36-13B and BM 36-13D were collected on October 23, November 7, and November 14, 2008.

The composite samples were collected by extracting approximately one (1) to two (2) liter aliquots (depending on the number of tanks) of fluid from each frac tank and gently discharging into a decontaminated 5-gallon bucket. Composite sample aliquots were then taken from the 5-gallon bucket and placed in the appropriately preserved laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler. Field parameters, temperature, pH, specific conductance, dissolved oxygen, oxidation-reduction potential, and turbidity, were measured on a separate sample aliquot at the well site.

The iced coolers were shipped by overnight carrier to the analytical laboratories for analysis of the radiological and nonradiological analytes listed in Tables 3 and 4 of the RSAP (URS 2008). The analytical laboratories used included GEL Laboratories LLC in Charleston, South Carolina (for radionuclides other than ^3H), Paragon Analytics in Fort Collins, Colorado (for non-radionuclides and radionuclides other than ^3H for rush analyses), and Isotech Laboratories, Inc. in Champaign, Illinois (for ^3H).

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 5. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

2.3 *Tier I Production Monitoring*

2.3.1 *First Gas Delivery Sampling and Analysis*

Noble Tier I gas well BM 36-13B was brought into production during the fourth quarter of 2008. First gas sales at BM 36-13B occurred on November 13, 2008. Produced water and natural gas

at this well was sampled on December 9, 2008. This well was sampled to fulfill the RSAP requirement for sampling new producing gas wells as soon as possible after fracing but no later than 30 days after first gas delivery.

Produced water and natural gas was sampled in accordance with the RSAP (URS 2008). Produced water was obtained from an effluent line at the separator or storage tank. If more than one gas well was plumbed to the separator, valves were closed by the Company representative to isolate the gas well of interest. The residual fluids in the produced water and natural gas lines were discharged so that a well-specific sample was obtained.

Produced water was collected by gently discharging the water from the effluent line into a clean 5-gallon bucket until full. Sample aliquots were then taken from the 5-gallon bucket and placed in the appropriately preserved laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler. Field parameters, temperature, pH, specific conductance, dissolved oxygen, oxidation-reduction potential, and turbidity, were measured on a separate sample aliquot at the well site.

Natural gas was sampled by connecting a braided steel sampling hose between the sampling port on the separator line and a laboratory-supplied, evacuated 20-pound gas tank. The sampling hose was flushed with natural gas prior to collecting the sample. The gas tanks are shipped under vacuum from the laboratory, so flushing of the gas tank was not required prior to filling. Because the gas sampling tanks are under vacuum, sampling simply involves opening the sampling hose and tank valves and allowing the tank to fill to capacity. Once filled, the valve on the sampling tank and sample port were closed. The Company representative returned any closed valves at the separator to their initial open configuration.

The iced coolers and gas tanks were shipped by overnight carrier to the analytical laboratories for analysis of the radiological and nonradiological analytes listed in Tables 3 and 4 of the RSAP (URS 2008). The analytical laboratories used included GEL Laboratories LLC in Charleston, South Carolina (for radionuclides other than ^3H), Paragon Analytics in Fort Collins, Colorado (for non-radionuclides), and Isotech Laboratories, Inc. in Champaign, Illinois (for ^3H in produced water and ^3H , carbon-14 (^{14}C), and gas composition in natural gas).

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 6. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

2.3.2 Quarterly Tier I Well Sampling and Analysis

Quarterly sampling of produced water and natural gas was attempted at three existing Noble Tier I gas wells BM 35-32A, BM 36-13, and BM 36-23 on December 9, 2008. Samples were not obtained at BM 36-13 and BM 36-23 because these wells were shut in and not producing. Sampling at these wells was attempted to fulfill RSAP requirements for quarterly sampling of the existing Tier I producing gas wells for one year. Quarterly sampling is also required for the closest Tier I gas well within each monitoring sector. At present, Noble Tier I wells BM 36-13, BM 36-13B, and BM 35-32A are also the closest wells within monitoring sectors 6, 7, and 8, respectively. First gas sales occurred at BM 36-13B on November 13, 2008 and produced water and natural gas was sampled on December 9, 2008.

Produced water and natural gas was sampled and analyzed in accordance with the RSAP as discussed in Section 2.3.1. The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 6. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

2.4 *Tier I Conditions of Approval (COA) Monitoring*

2.4.1 Drill Cuttings Sampling and Analysis

Composite drill cuttings samples were also collected from Noble's 26N pad on November 7, 2008. These samples were collected to fulfill permit COAs regarding analysis of cuttings prior to removal from a well pad.

The composite samples were prepared by collecting approximately 10 aliquots of drill cuttings from the reserve pit stockpile at the north end of the well pad and placing them directly in a clean 5-gallon bucket. The sample aliquots were composited and placed in the laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler.

The iced sample coolers were shipped by overnight carrier to the analytical laboratories for analysis of the radiological analytes listed in Table 3 of the RSAP (URS 2008). The analytical laboratory used included Paragon Analytics in Fort Collins, Colorado.

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Table 2. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

3 Tier II Monitoring

3.1 *Tier II Drilling Monitoring*

3.1.1 Gamma-Ray Log Review

Open- or cased-hole gamma-ray logs through the Williams Fork Formation interval in Tier II gas wells were reviewed to determine whether any evidence of Project Rulison-related gamma radiation was encountered in the borehole.

3.2 *Tier II Production Monitoring*

3.2.1 First Gas Delivery Sampling and Analysis

Noble's Tier II gas wells, BM 34-11A, BM 34-12B, BM 34-21A, and BM 36-13D, were brought into production during the fourth quarter of 2008. First gas sales at BM 34-11A, BM 34-12B, and BM 34-21A occurred on September 27, 2008 and produced water and natural gas was sampled on October 6, 2008. First gas sales at BM 36-13D occurred on November 17, 2008 and produced water and natural gas was sampled on December 9, 2008. Williams Tier II gas wells SP 22-13, SP 411-13, and SP 531-13 were also brought into production during the fourth quarter of 2008. First gas sales at SP 411-13 occurred on October 31, 2008 and at SP 22-13 and SP 531-13 on November 6, 2008. Produced water and natural gas at these wells was sampled on November 18, 2008. These wells were sampled to fulfill the RSAP requirement for sampling new Tier II producing gas wells as soon as possible after fracing but no later than 30 days after first gas delivery.

Produced water and natural gas was sampled and analyzed in accordance with the RSAP as discussed in Section 2.3.1. The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 6. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

3.2.2 Quarterly Tier II Gas Well Sampling and Analysis

Quarterly Tier II sampling was attempted at Noble's Tier II BM 26-42 gas well during the fourth quarter 2008. At present, BM 26-42 is the closest well within monitoring sector 9 but was not sampled because the well was, and remains, shut in and is not producing because of drilling activities on the 26N pad.

3.3 Tier II Baseline Monitoring

One-time baseline monitoring of existing Noble Tier II producing gas well Chevron 34-4 was performed on October 31, 2008. Baseline sampling of the existing Tier II producing gas wells was required within 90 days after the approval of the RSAP, however, Chevron 34-4 was not producing during the initial baseline sampling conducted during the second quarter 2008 because it was shut in while drilling occurred on the 34C pad. Gas production at Noble's Chevron 34-4 gas well was resumed during the fourth quarter 2008 and the baseline sampling was performed to fulfill the RSAP requirement.

Produced water and natural gas was sampled and analyzed in accordance with the RSAP as discussed in Section 2.3.1. The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 6. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

3.4 Tier II Conditions of Approval (COA) Monitoring

3.4.1 Fracing and Flowback Fluid Sampling and Analysis

Composite samples of fracing and flowback fluids were sampled at EnCana's Tier II Federal Hagen 15-13BB gas well on December 10, 2008 to fulfill permit COAs. The fracing fluid was sampled from a lined storage pit on an adjacent well pad and the flowback fluids were sampled from frac tanks.

Fracing and flowback fluids were sampled and analyzed in accordance with the RSAP as discussed in Section 2.2. The analytical laboratories used included GEL Laboratories LLC in Charleston, South Carolina (for ^{36}Cl), Paragon Analytics in Fort Collins, Colorado (for radionuclides, other than ^3H and ^{36}Cl , and non-radionuclides), and Isotech Laboratories, Inc. in Champaign, Illinois (for ^3H).

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 5. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

3.4.2 Drill Cuttings Sampling and Analysis

Composite drill cuttings samples were also collected from EnCana's Tier II gas wells, Federal 21-15BB, Federal 21-10BB, and Federal 21-10, drilled on the PK-21 pad on October 13, 22, and 29, 2008, respectively. These samples were collected to fulfill permit COAs.

The composite samples were prepared by collecting approximately 10 aliquots of drill cuttings from the lined pits and placing them directly into a clean 5-gallon bucket. The sample aliquots were composited and placed in the laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler.

The iced sample coolers were shipped by overnight carrier to the analytical laboratories for analysis of the radiological analytes listed in Table 3 of the RSAP (URS 2008). The analytical laboratory used included Paragon Analytics in Fort Collins, Colorado.

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Table 2. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

3.4.3 Drilling Fluid Sampling and Analysis

Grab samples of dewatered drilling mud solids and extracted drilling mud fluid were collected at EnCana's Tier II PK-21 pad following completion of drilling the Federal 21-10 gas well on October 29, 2008 to fulfill permit COAs.

The extracted drilling mud fluid sample was collected by gently discharging approximately 5 gallons of fluid from the storage tank on the well pad into a clean 5-gallon bucket. Sample aliquots were taken from the 5-gallon bucket and placed in appropriately preserved, laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler. Field parameters, temperature, pH, specific conductance, dissolved oxygen, oxidation-reduction potential, and turbidity, were measured on a separate sample aliquot at the well site.

A composite sample of the dewatered drilling mud solids was prepared by collecting approximately 10 solids aliquots from the lined pit on the pad and placing them directly in a clean 5-gallon bucket. The sample aliquots were composited and placed in the laboratory-supplied sample bottles. Once filled, the sample bottles were capped, labeled, documented on the COC, and placed in an iced cooler.

The iced sample coolers were shipped by overnight carrier to the analytical laboratories for analysis of the radiological and nonradiological analytes listed in Tables 3 (fluid and solids) and 4 (fluid only) of the RSAP (URS 2008). The analytical laboratories used included Paragon Analytics in Fort Collins, Colorado (for radionuclides and non-radionuclides other than ^3H), and Isotech Laboratories, Inc. in Champaign, Illinois (for ^3H).

The analytical results are included in the laboratory data packages in Appendix A and are summarized in Tables 2 through 5. Laboratory data were independently validated by URS. Data validation reports are included in Appendix B. Field sampling records are included in Appendix C.

4 Annual Areal Environmental Monitoring

Annual areal environmental monitoring was performed during the fourth quarter 2008. The annual areal environmental monitoring was performed during the week of October 13 through 16, 2008. The results will be reported in the 2008 Annual Environmental Monitoring Report.

5 Results

5.1 Dosimeter Results

The dosimeter results for the gas wells drilled on Noble's 26N pad have not been received from Landauer and will be reported in the first quarter 2009 report. An approximate estimate of the dose rate is provided by the real-time gamma radiation monitoring that was conducted on the 26N pad between September 5 and December 27, 2008. The real-time gamma radiation monitoring indicates that an average gamma radiation exposure rate of 3.79 ± 0.38 microRoentgen per hour ($\mu\text{R}/\text{hr}$) was encountered during drilling of Tier I wells on the 26N pad. The gamma radiation exposure rate ranged between 2.4 and 9.7 $\mu\text{R}/\text{hr}$. This gamma radiation exposure rate is typical of natural background gamma radiation.

5.2 Real-Time Tritium Monitoring Results

Real-time tritium monitoring was performed during drilling of Noble's Tier I gas wells BM 26-33B, BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, and BM 26-34D on the 26N pad. Tritium activity measurements were made at the drilling fluid and cuttings outfall (i.e., possum belly). The results of the real-time tritium monitoring at Noble's Tier I gas wells on the 26N pad indicate that the mean tritium activity was $2.6\text{E}-8 \pm 1.8\text{E}-7$ microCuries per cubic centimeter ($\mu\text{Ci}/\text{cc}$), which is less than the instrument detection limit of $5.0\text{E}-7 \mu\text{Ci}/\text{cc}$. A total of 3,110,115 tritium activity measurements were recorded during drilling of Noble's Tier I gas wells on the 26N pad. The minimum and maximum tritium activities measured during drilling of these wells were $1.0\text{E}-9$ and $6.1\text{E}-6 \mu\text{Ci}/\text{cc}$. The tritium activity results are within background.

5.3 Real-Time Gamma Radiation Monitoring Results

Real-time gamma radiation monitoring was performed during drilling of Noble's Tier I gas wells BM 26-33B, BM 26-33C, BM 26-33D, BM 26-34A, BM 26-34B, and BM 26-34D on the 26N pad. Gamma radiation exposure measurements were made at the drilling fluid and cuttings outfall (i.e., possum belly). The results of the real-time gamma ray monitoring at Noble's Tier I gas wells on the 26N pad indicate that the mean gamma radiation exposure rate was $3.79 \pm 0.38 \mu\text{R}/\text{hr}$. A total of 914,620 gamma radiation exposure measurements were recorded during drilling of these Tier I wells. The minimum and maximum gamma radiation exposure rates observed during drilling of these wells ranged between 2.4 and 9.7 $\mu\text{R}/\text{hr}$. These gamma radiation exposure rates are within the background range for gamma radiation.

5.4 Gamma-Ray Log Results

The results of the gamma-ray log review for Tier I and II gas wells indicates that none of the gamma-ray measurements exceeded 500 American Petroleum Institute (API) units in the Williams Fork Formation. Gamma-ray intensities measured are typical of the Williams Fork Formation measured to date. No evidence of Project Rulison-related gamma radiation was encountered in any of the logs reviewed.

5.5 Tier I and II Radiological Analytical Results

Gross alpha, gross beta, gamma-emitting radionuclides, strontium-90 (^{90}Sr), technetium-99 (^{99}Tc), and chlorine-36 (^{36}Cl) activities were analyzed in produced water (PW), fracing water (FW), flowback fluid (FB), drill cuttings (DC), drilling mud (DM), dewatered drilling mud solid (MS), and extracted drilling mud fluid (MF) collected at Tier I and II gas wells or well pads during the fourth quarter 2008. ^3H was analyzed in water, fluid, and natural gas (NG) samples. Carbon-14(^{14}C) was also analyzed in natural gas from the producing wells sampled.

The results of the radiological analyses are summarized in Table 2. Table 2 includes both radionuclides detected and those that were analyzed but were not detected. The table is sorted so that the detected radionuclides occur at the top. These data were independently validated by URS and most of the radiological results were found to be usable without qualification. Data that are deemed usable as qualified or unusable are flagged and identified in the data validation reports (Appendix B).

5.5.1 Gross Alpha Results

Gross alpha activities in produced water (PW), fracing water (FW), flowback fluid (FB), and extracted drilling mud fluid (MF) ranged between not detected (less than 2.54) and 128 ± 45 picoCuries per liter (pCi/L). Gross alpha activity was generally reported at an elevated reporting activity because of the high total dissolved solids (TDS) concentration of these fluid samples. The high TDS concentrations resulted in the evaporation of a smaller sample volume during analysis because the gross alpha analytical method limits the residue after evaporation to 100 milligrams or less. The lowest gross alpha activity detected ($3.53 \pm 2.76\text{pCi/L}$) occurred in produced water from Noble's Tier II BM 34-11A gas well. The highest gross alpha activity detected (128 ± 45 pCi/L) occurred in fracing fluid (prior to its use) from Noble's 34C pad. The gross alpha activity detected is related to naturally occurring alpha-emitting radionuclides, primarily ^{238}U , ^{232}Th , and their daughter products (Figures 2 and 3), found in the subsurface formation fluids or fluids used for drilling or completion.

Gross alpha activities in drill cuttings (DC), drilling mud (DM), and dewatered drilling mud solid (MS) ranged between 2.5 ± 1 and 29.7 ± 7.05 picoCuries per gram (pCi/g). The lowest gross alpha activity detected (2.5 ± 1 pCi/g) occurred in drill cuttings from EnCana's Tier II Federal 21-10 gas well. The highest gross alpha activity detected (29.7 ± 7.05 pCi/g) occurred in drilling mud obtained prior to drilling at Noble's Tier I BM 26-33B gas well. The gross alpha activity detected is related to naturally occurring alpha-emitting radionuclides, primarily ^{238}U , ^{232}Th , and their daughter products (Figures 2 and 3), found in the drilling mud and subsurface rock formations.

5.5.2 Gross Beta Results

Gross beta activities in produced water, fracing water, flowback fluid, and extracted drilling mud fluid ranged between not detected (less than 26.2) and $7,040 \pm 151$ pCi/L. The highest gross beta activity detected ($7,040 \pm 151$ pCi/L) occurred in fracing water (prior to its use) from Noble's Tier I 36L pad. The lowest gross beta activity detected (4.98 ± 3.03 pCi/L) occurred in produced water from Noble's Tier II BM 34-12B gas well.

The elevated gross beta activities are related to naturally occurring potassium-40 (^{40}K) in the subsurface formation fluids or waters used for drilling and completion. ^{40}K activities in these fluids ranged between not detected (less than 39.9) and $9,950 \pm 644$ pCi/L. These values are consistent with the gross beta activities reported above. The highest ^{40}K activity detected ($9,950 \pm 644$ pCi/L) occurred in fracing water (prior to its use) from Noble's Tier I 36L pad. The lowest ^{40}K activity detected (66.9 ± 37.9 pCi/L) occurred in produced water at Williams Tier II SP 22-13 gas well.

Gross beta activities in drill cuttings, drilling mud, and dewatered drilling mud solid ranged between not detected (less than 2.8) and 52.7 ± 4.58 pCi/g. The highest gross beta activity detected (52.7 ± 4.58 pCi/g) occurred in Williams Fork Formation drill cuttings from Noble's Tier I BM 26-33B gas well. The lowest gross beta activity detected (2.41 ± 0.83 pCi/g) occurred in drill cuttings from Noble's 26N well pad.

The elevated gross beta activities are typically related to naturally occurring potassium-40 (^{40}K) in the subsurface rock formations or drilling mud constituents. ^{40}K is one of the most abundant naturally occurring radionuclides and primarily occurs in the clay and mica minerals that comprise the surface soils and shales found in the subsurface and drilling mud. ^{40}K activities in these solid media ranged between 11.3 ± 0.5 and 23.7 ± 2.8 pCi/g. The highest ^{40}K activity detected (23.7 ± 2.8 pCi/g) occurred in dewatered drilling mud solid from EnCana's Tier II Federal 21-10 gas well on the PK-21 pad. The lowest ^{40}K activity detected (11.3 ± 0.5 pCi/g) occurred in drill cuttings from EnCana's Tier II Federal 21-10 gas well.

5.5.3 ^{90}Sr and ^{99}Tc Results

^{90}Sr and ^{99}Tc , common radionuclides in the inventory at Project Rulison, were not detected above their reporting activities in most of the fluid media (produced water, fracing water, flowback fluid, and extracted drilling mud fluid) or solid media (drill cuttings, drilling mud, and dewatered drilling mud solid) samples analyzed during the fourth quarter 2008. The ^{90}Sr and ^{99}Tc fluid media reporting activities ranged between less than 0.546 and less than 6.4 pCi/L, and less than 18 and less than 45.3 pCi/L, respectively. The ^{90}Sr and ^{99}Tc solid media reporting activities ranged between less than 0.37 and less than 1.05 pCi/g, and less than 2.65 and less than 4.24 pCi/g, respectively.

^{90}Sr and ^{99}Tc were detected in a fracing fluid (prior to its use) at EnCana's Tier II Federal Hagen 15-13BB gas well at activities of 6.2 ± 3.6 and 84 ± 42 pCi/L, respectively. These results are slightly higher than their analytical reporting limits of 5.9 and 68 pCi/L. The fracing fluid was obtained from outside the Project Rulison monitoring zone and was stored in a lined pit on an adjacent well pad. Although these ^{90}Sr and ^{99}Tc detections are likely false positives, they may have been present, having been introduced into the fracing fluid, which was stored outdoors, from the atmosphere or fugitive dust. ^{90}Sr is a common component of fallout from atmospheric testing of nuclear weapons. Regardless of whether these reported isotopes are false positives or not, these ^{90}Sr and ^{99}Tc occurrences are not verified Project Rulison radionuclide detections as the fracing fluids were from sources outside the Project Rulison monitoring zone.

^{99}Tc was also detected in comingled flowback fluid collected on November 14, 2008 from Noble's Tier I and II BM 36-13B and BM 36-13D gas wells on the 36L pad at an activity of 770 ± 200 pCi/L. ^{99}Tc activities in previous flowback fluids collected on October 23, 2008 and subsequent produced water samples collected on December 9, 2008 at both of these wells were not detected (less than 30.5 pCi/L) and, thus, did not confirm the reported ^{99}Tc detection in the flowback fluid sample collected on November 14, 2008. Therefore, in accordance with RSAP Section 4.4.2, no reporting to the Agencies was required as the ^{99}Tc detection was not verified through analysis of previous or subsequent samples. No other Project Rulison-related radionuclides, including tritium, were detected in the flowback fluids or produced water samples from these wells. These results suggest that the reported ^{99}Tc detection in the flowback fluid on November 14th may be a false positive.

5.5.4 ^{36}Cl Results

^{36}Cl , a less common radionuclide in the inventory at Project Rulison, was not detected above its reporting activities in most of the produced water, fracing water, flowback fluid, drilling mud, or dewatered drilling mud fluid samples analyzed during the fourth quarter 2008. The ^{36}Cl

reporting activities ranged between less than 153 and less than 567 pCi/L for fluid samples and less than 1.48 and less than 5.92 pCi/g for solid media.

^{36}Cl was reported as detected in four fracing fluid samples prior to their use at Noble's BM 36-13B and BM36-13D gas wells on the 36L pad (258 ± 136 pCi/L), at Noble's 34C pad (455 ± 160 pCi/L and 518 ± 289 (J) pCi/L), and at EnCana's Federal Hagen 15-13BB gas well (438 ± 176 pCi/L). The fracing fluids used at Noble's 34C and 36L pads and EnCana's Federal Hagen 15-13BB gas well were obtained from sources outside the Project Rulison monitoring zone, thus, the ^{36}Cl results at these locations do not represent verified Project Rulison radionuclide contamination. These reported ^{36}Cl occurrences may be false positives since ^{36}Cl was not detected in any of the flowback fluids or produced waters following fracing at these pads.

Similarly, ^{36}Cl was detected in drilling mud (prior to its use) at Noble's BM 26-33C gas well (5.22 ± 3.28 pCi/g) and, thus, does not represent verified Project Rulison radionuclide contamination. ^{36}Cl was not detected in any of the other drilling mud samples analyzed prior to or after use in borings at Noble's 26N pad, thus, the ^{36}Cl detections in the drilling mud prior to its use at BM 26-33C may also be a false positive.

5.5.5 Gamma-Emitting Radionuclide Results

Most of the gamma-emitting radionuclides in fluid media (produced water, fracing fluid, flowback fluid, extracted drilling mud fluid) and solid media (drill cuttings, drilling mud, and dewatered drilling mud solid) samples analyzed during the fourth quarter 2008 were not detected above their reporting activities. Table 2 provides a summary of the gamma-emitting radionuclide results.

Most of the gamma-emitting radionuclides detected were those that naturally occur in the subsurface formation fluids and rocks in the Williams Fork Formation, fracing and flowback fluids, and drilling mud constituents. Naturally occurring gamma-emitting radionuclides detected included actinium-228 (^{228}Ac), bismuth-212 (^{212}Bi), bismuth-214 (^{214}Bi), ^{40}K , lead-210 (^{210}Pb), lead-212 (^{212}Pb), lead-214 (^{214}Pb), protactinium-234m ($^{234\text{m}}\text{Pa}$), radium-226 (^{226}Ra), radium-228 (^{228}Ra), thallium-208 (^{208}Tl), thorium-230 (^{230}Th), thorium-234 (^{234}Th), and uranium-238 (^{238}U). All of these radionuclides, except for ^{238}U and ^{40}K , are decay products of the thorium-232 (^{228}Ac , ^{212}Bi , ^{212}Pb , ^{228}Ra , and ^{208}Tl) and uranium-238 (^{214}Bi , ^{210}Pb , ^{214}Pb , $^{234\text{m}}\text{Pa}$, ^{226}Ra , ^{230}Th , and ^{234}Th) decay series. The thorium and uranium series decay chains are shown as Figures 2 and 3.

Several anthropogenic gamma-emitting radionuclides were reported as detected in drill cuttings, drilling mud samples, fracing fluids, or flowback fluids. The reported isotopes included

antimony-124 (^{124}Sb), cesium-134 (^{134}Cs), cobalt-56 (^{56}Co), europium-155 (^{155}Eu), krypton-85 (^{85}Kr), neptunium-239 (^{239}Np), and sodium-22 (^{22}Na). The table below summarizes the reported isotope occurrences.

Well	Tier	Medium	Isotopes Reported
Noble 26N Pad	Tier I and II	Drill Cuttings	^{56}Co , ^{134}Cs , ^{155}Eu , ^{85}Kr , ^{124}Sb
Noble 36L Pad	Tier I and II	Fracing Fluid (before use)	^{85}Kr
EnCana Federal 21-10	Tier II	Drill Cuttings	^{56}Co , ^{134}Cs
EnCana Federal 21-10BB	Tier II	Drill Cuttings	^{56}Co
EnCana Federal 21-15BB	Tier II	Drill Cuttings	^{134}Cs , ^{155}Eu
EnCana PK-21 Pad	Tier II	Extracted Mud Fluid	^{56}Co
EnCana PK-21 Pad	Tier II	Dewatered Mud Solids	^{56}Co , ^{239}Np
EnCana Federal Hagen 15-13BB	Tier II	Fracing Fluid (before use)	^{85}Kr
EnCana Federal Hagen 15-13BB	Tier II	Flowback Fluid	^{22}Na

All of these radionuclides, except ^{155}Eu , were specified as tentatively identified by the laboratory. These reported detections may be false positives. This judgment is based on the following rationale:

- All of these possible false positive results are from the same laboratory, Paragon Analytics. These isotopes have not been reported in other radionuclide analyses performed on similar media by GEL Laboratories;
- All of these isotopes, except ^{155}Eu , were reported by the laboratory as tentatively identified because of inadequate gamma ray intensity, the diagnostic peak was not identified above a critical level, or the minimum library peak abundance was not attained. These data were subsequently qualified during data validation as estimated (J);
- Several gamma ray peaks of naturally occurring radionuclides, notably ^{228}Ac , ^{214}Bi , and ^{208}Tl , which were identified in the drill cuttings and drilling mud samples, are nearly

coincident with the primary peak of some of these isotopes (e.g., ^{56}Co and ^{239}Np) and often result in false identification. ^{239}Np was not detected in a duplicate analysis;

- Most of these isotopes are not likely formed by a nuclear fission device, or if formed by fission are of low abundance, and were not identified as abundant in the Project Rulison inventory;
- All of these radionuclides, except ^{85}Kr , have relatively short half lives, less than 5 years, are not sourced from or decay to longer-lived isotopes, and, thus, would have decayed to less than 0.3 percent of their initial activity, even if they were present at Project Rulison;
- These isotopes would be expected to be accompanied by more abundant and longer lived gamma-emitting radionuclides, such as ^{137}Cs , ^{152}Eu , or ^{154}Eu , that are known to occur in the Project Rulison inventory. None of these more abundant or longer lived gamma-emitting radionuclides were detected in the drill cuttings;
- Results from drill cuttings in adjacent EnCana boreholes on the same pad did not confirm the presence of these isotopes;
- Results from other flowback fluids and produced waters following fracing at Noble's BM 36-13B and BM 36-13D gas wells did not confirm the presence of these isotopes;
- The EnCana gas wells are located almost three miles northwest of Project Rulison at the outer edge of the Tier II monitoring zone. It is not likely that Project Rulison-related radionuclides could have been transported that distance given the low permeability characteristics of the Williams Fork Formation; and
- ^{85}Kr was detected in fracing fluids (prior to their use) at Noble's 36L pad and EnCana's Federal Hagen 15-13BB gas well and in drill cuttings at Noble's 26N well pad. In both cases, the fracing fluids were obtained from sources outside of the Project Rulison monitoring zone, and, thus, are not related to Project Rulison. ^{85}Kr would not be expected in the drill cuttings as it is a gas and should have volatilized if present, since the cuttings were stockpiled outdoors at the pad for over a month before being sampled.

5.5.6 ^3H Results in Produced Waters and Other Fluids

^3H , the most abundant and mobile radionuclide in the inventory at Project Rulison, was not detected above the reporting concentration in any of the produced water, fracing water, flowback fluid, or extracted drilling mud fluid samples analyzed during the fourth quarter 2008. The ^3H reporting concentrations ranged between less than 10 and less than 18.7 tritium units (TU). One

TU equals 1 tritium atom per 10^{18} hydrogen atoms or approximately 3.19 pCi/L (Kazemi et al. 2006). Thus, the ^3H activities in these fluid samples ranged between less than 32 to less than 60 pCi/L. The Colorado Department of Public Health and Environment (CDPHE) basic ground water standard for ^3H is 20,000 pCi/L (CDPHE 2008).

5.5.7 Tritium and ^{14}C in Natural Gas Results

^3H was not detected above its reporting concentration in the methane fraction of natural gas samples collected at producing gas wells during the fourth quarter 2008. ^3H reporting concentrations ranged between less than 10 and less than 16.7 TU (Table 2). One TU equals 1 tritium atom per 10^{18} hydrogen atoms or approximately 3.19 pCi/L (Kazemi et al. 2006). Thus, the ^3H activities in these gas samples ranged between less than 32 and less than 53 pCi/L.

^{14}C concentrations in the methane fraction of the natural gas samples ranged between not detected (less than 0.2) and 0.5 ± 0.1 percent modern carbon (pMC) as shown in Table 2. ^{14}C is reported as pMC which is set by convention as 13.56 decays per minute per gram of carbon (Kazemi et al. 2006), or 100 pMC. ^{14}C results less than 1 pMC indicate that modern ^{14}C is not present in the gas and that the natural gas has been isolated from sources of modern ^{14}C such as Project Rulison.

5.5.8 Radiological Results Summary

Project Rulison-related radionuclides, including the most abundant radionuclides in the Project Rulison inventory (Table 1 in URS 2008), ^3H , ^{137}Cs , ^{90}Sr , and ^{99}Tc were not detected above their reporting activities in any of the produced water, fracing fluid, flowback fluid, drill cuttings, drilling mud, extracted drilling mud fluid, dewatered drilling mud solid, or natural gas samples sourced within the Project Rulison monitoring zone. Thus, no verified Project Rulison-related radionuclides were detected during the fourth quarter 2008.

^{99}Tc reported in comingled flowback fluid from Noble's Tier I BM 36-13B and Tier II BM 36-13D gas wells may be a false positive, as ^{99}Tc was not detected in the previous flowback fluid samples or subsequent produced water samples collected at these wells. ^{85}Kr detected in fracing water prior to its use on Noble's 36L pad and ^{85}Kr , ^{90}Sr , and ^{99}Tc in fracing fluid (prior to its use) at EnCana's Federal Hagen 15-13BB gas well are not related to Project Rulison, as the fracing fluids were obtained from sources outside of the Project Rulison monitoring zone.

Several short-lived gamma-emitting radionuclides (^{124}Sb , ^{134}Cs , ^{56}Co , ^{239}Np , ^{155}Eu , and ^{22}Na) were tentatively identified in drill cuttings and drilling mud from EnCana's Tier II Federal 21-10, Federal 21-10BB, and Federal 21-15BB gas wells also may be false positives as they were tentatively identified by the laboratory and qualified as estimated during data validation,

generally do not appear to be likely or abundant fission products, are not identified in the Project Rulison inventory, are not found with more abundant Project Rulison-related radionuclides, and their detection was not confirmed in samples from adjacent wells. The only verified gamma-emitting radionuclides detected (e.g., ^{238}U , ^{232}Th , and their daughter products) are those that naturally occur in the subsurface formation fluids and rocks in the Williams Fork Formation and drilling mud clays and fluids.

5.6 *Tier I and II Non-Radiological Analytical Results*

Total metal and inorganic and organic constituent concentrations were analyzed for produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid samples collected during the fourth quarter 2008. The composition of natural gas samples from producing wells was also determined. The results of nonradiological analyses (i.e., total metals, inorganic parameters, organic constituents, and natural gas composition) are summarized in Tables 3 through 6. Independent data validation by URS indicates that most of the non-radiological results are usable without qualification. Data that are deemed usable as qualified or unusable are flagged and identified in the data validation reports (Appendix B).

5.6.1 Major Cation and Trace Metal Results

Total metals in produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid samples analyzed during the fourth quarter 2008 were determined for major cations (calcium, magnesium, sodium, and potassium) and trace metals (arsenic, barium, boron, cadmium, chromium, iron, lead, lithium, manganese, mercury, selenium, strontium, and uranium). The analytical results indicate that these metals are detected at varying concentrations within each of these media. The results of the major cation and trace metal analyses are summarized in Table 3.

Sodium and potassium are the dominant major cations in the produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid samples analyzed. The mean sodium and potassium concentrations detected are 3,883,100 micrograms per liter ($\mu\text{g/L}$) and 2,182,526 $\mu\text{g/L}$, respectively. Calcium and magnesium in these fluids are found at significantly lower concentrations compared to sodium and potassium. The mean calcium and magnesium concentrations are 212,867 $\mu\text{g/L}$ and 30,420 $\mu\text{g/L}$, respectively.

Iron, barium, strontium, boron, lithium, and manganese are the dominant trace metals in produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid samples analyzed. Mean iron, barium, strontium, boron, lithium, and manganese concentrations in these fluids are 42,403, 38,980, 23,042, 3,519, 3,072, and 1,009 $\mu\text{g/L}$, respectively. Mean concentrations of less common trace metals in these fluids, lead (22.7 $\mu\text{g/L}$), chromium (20.2 $\mu\text{g/L}$), and arsenic (14.3

$\mu\text{g/L}$), are less than 25 $\mu\text{g/L}$. The mean concentrations of the remaining trace metals analyzed, uranium (1.61 $\mu\text{g/L}$), cadmium (1.11 $\mu\text{g/L}$), mercury (2.02 $\mu\text{g/L}$), and selenium (0.87 $\mu\text{g/L}$) are less than 5 $\mu\text{g/L}$.

5.6.2 Major and Minor Anion and pH Results

Major and minor anions and pH in produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid samples were analyzed during the fourth quarter 2008. The results of these analyses are summarized in Table 4. Chloride is the dominant major anion in the fluid samples analyzed. The mean chloride concentration is 13,428 milligrams per liter (mg/L). Chloride is the primary constituent comprising the mean total dissolved solids (TDS) concentration (23,365 mg/L). The next most abundant major anion in these fluids is bicarbonate (as CaCO_3) whose mean concentration is 1,202 mg/L. Bicarbonate is the primary constituent comprising the mean total alkalinity (as CaCO_3) of 1,202 mg/L. The mean pH for these fluids is 7.20, which is consistent with bicarbonate being the dominant carbonate component in these fluids.

Sulfate, bromide, ammonia (as N), and fluoride are the predominant minor anions in produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid, with mean concentrations of 185, 47, 17, and 6 mg/L, respectively. The occurrence of ammonia suggests that these fluids are generally reducing, resulting in the reduction of nitrogen to a -3 oxidation state. The reducing conditions are also consistent with the high dissolved iron concentrations and iron oxyhydroxide precipitates often observed during sampling.

5.6.3 Gasoline, Diesel, and Motor Oil Constituent Results

Produced water, fracing fluid, flowback fluid, and extracted drilling mud fluid samples were analyzed for gasoline, diesel, and motor oil range constituents during the fourth quarter 2008. The results of these analyses are summarized in Table 5. These fluid media had a mean dissolved petroleum hydrocarbon concentration of 2,111 mg/L. The mean dissolved petroleum hydrocarbons are comprised of 1,798 mg/L diesel range organics (DRO), 58 mg/L gasoline range organics (GRO), and 255 mg/L motor oil range organics (MRO). Mean dissolved benzene, ethylbenzene, toluene, m+p-xylenes, and o-xylenes (BTEX) concentrations are 3,167, 1,188, 12,757, 16,943 and 2,617 $\mu\text{g/L}$, respectively. Total xylenes (53 percent) and toluene (35 percent) comprise the bulk of the dissolved BTEX constituents in these fluids. The mean dissolved methane concentration is 1,525 $\mu\text{g/L}$.

5.6.4 Gas Composition Results

The natural gas composition was determined during the fourth quarter 2008. The results of these analyses are summarized in Table 6. Natural gas composition analyses indicate that methane is

the predominant component of the gas. The mean methane gas component comprises 87.04 percent. Carbon dioxide (6.60 percent), ethane (4.36 percent), and propane (1.08 percent) comprise the next most abundant natural gas components. These four constituents comprise about 99 percent of the natural gas. The remaining 1 percent of the gas is comprised of iso-butane (0.23 percent), n-butane (0.21 percent), nitrogen (0.20 percent), C6+ (0.12 percent), iso-pentane (0.08 percent), n-pentane (0.06 percent), oxygen (0.02 percent), and traces of hydrogen and helium.

The mean heating value at base conditions (14.696 pound per square inch atmosphere and 60 degrees Fahrenheit [$^{\circ}\text{F}$]; ASTM 2003) is 1,014 British thermal units per cubic foot (BTU/Ft 3). The mean relative gas density (calculated as the ratio of natural gas density to air density, ρ_g/ρ_a) is 0.662. The mean $\delta^{13}\text{C}$ value of the methane (C1) gas fraction is -37.5 parts per mil (i.e., parts per thousand; ‰) which suggests that the methane is thermogenic in origin.

5.6.5 Nonradiological Results Summary

The fourth quarter 2008 nonradiological results for produced waters, fracing fluids, flowback fluids, produced waters, drilling muds, and extracted drilling mud fluids are consistent with the nonradiological results reported for these media (where analyzed) during the third quarter 2008.
