Semiannual Monitoring Results of Natural Gas Wells near the Rulison, Colorado, Site
March 2017 Monitoring Event

U.S. Department of Energy Office of Legacy Management
Grand Junction, Colorado

Date Sampled: March 24, 2017

Background

The Rulison, Colorado, Site is in the Piceance Basin of western Colorado, 40 miles northeast of Grand Junction. The site, identified as Lot 11 (Figure 1), was the location of an underground nuclear test conducted by the U.S. Atomic Energy Commission (a predecessor agency to the U.S. Department of Energy [DOE]) in partnership with the Austral Oil Company Inc. and the nuclear engineering firm CER Geonuclear Corporation. The test was called Project Rulison, and it was designed to evaluate the use of a nuclear detonation to enhance gas production in a low-permeability sandstone reservoir. This was the second natural gas reservoir stimulation experiment in the Plowshare Program, which was a program to develop peaceful uses for nuclear energy. The device was detonated in the emplacement well (R-E) at a depth of 8426 feet (ft) below ground surface on September 10, 1969. It had a reported yield of 40 kilotons (DOE 2015), and the detonation created a temporary cavity, a collapse chimney, and a fractured zone surrounding the cavity (collectively known as the detonation zone). A sidetrack hole (reentry well) was drilled off the exploration well (R-Ex) into the chimney and tested to evaluate the success of the detonation at improving gas production. In 1976, the participating parties agreed that there would be no gas production at the site in the future, the R-E and R-Ex wells were abandoned, and a deed restriction was established for Lot 11. The deed restriction prohibits penetration or withdrawal of any material below 6000 ft within the boundary of Lot 11 unless authorized by the U.S. government.

Purpose

To ensure public safety, samples are collected from natural gas wells near the Rulison site. The samples are analyzed for radionuclides that may be associated with the detonation. Tritium is the most abundant radionuclide remaining in the detonation zone that can be present in the gas and aqueous phases. Its presence in water vapor (a minor constituent of natural gas) is the primary concern because gas is more mobile than liquid in a gas reservoir. The natural gas wells produce some liquids along with natural gas. The liquids (produced water and hydrocarbon condensate) are brought to the surface with the natural gas and mechanically separated at the wellhead. Produced water is a mixture of water vapor in the natural gas that condenses at the surface, formation water, and remnant water from hydrofracturing well development. Natural gas and produced water samples are collected for analysis. The Colorado Oil and Gas Conservation Commission (COGCC) requires that operators with gas wells within 3 miles of the Rulison site adhere to the *Rulison Sampling and Analysis Plan* developed by the COGCC (COGCC 2017). The DOE Office of Legacy Management (LM), in a separate effort, has implemented the *Rulison Monitoring Plan* (DOE 2010), which samples gas wells within 1 mile of the detonation zone. The *Rulison Monitoring Plan* and analytical results from past monitoring activities are available on the LM website at https://www.lm.doe.gov/Rulison/Documents.aspx. Analytical results obtained from LM's March 2017 monitoring event are summarized in the following sections.

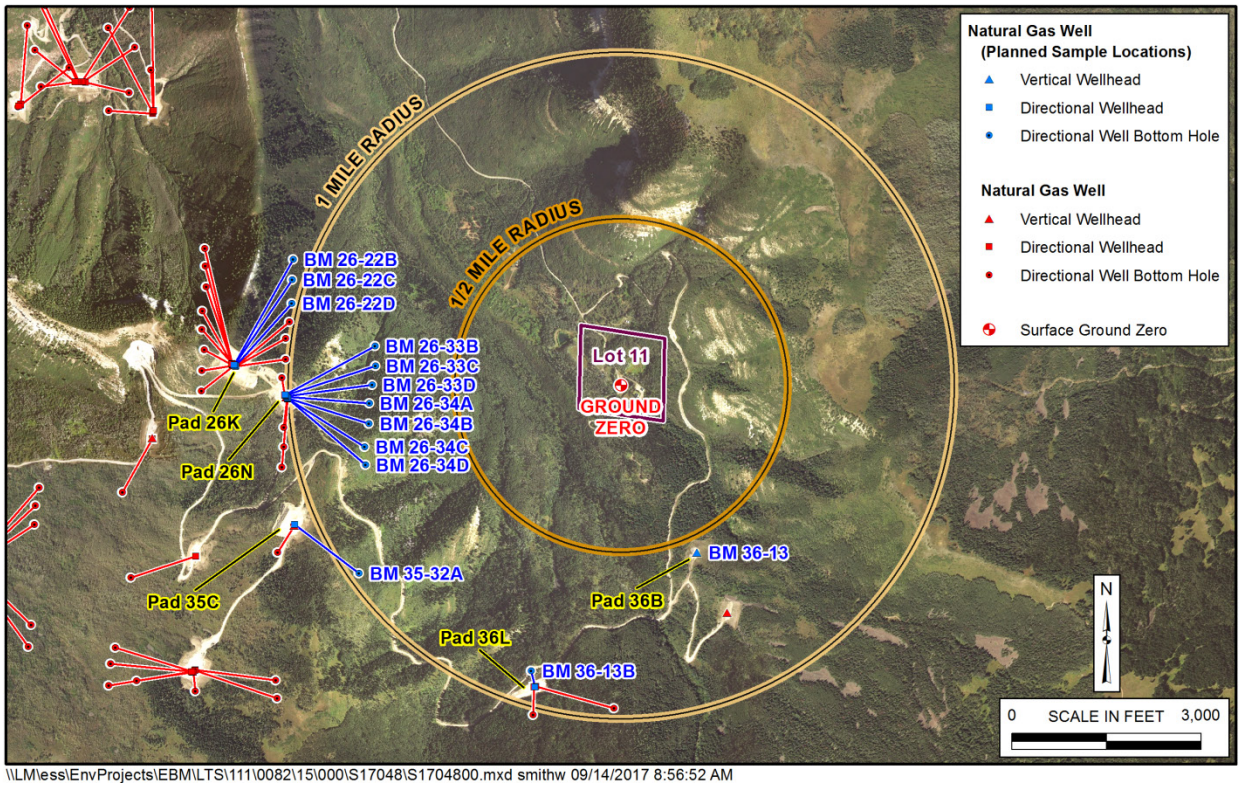

Figure 1. Rulison, Colorado, Site and Well Location Map

Monitoring Protocol

The *Rulison Monitoring Plan* provides guidance on the type of samples collected (natural gas or produced water), laboratory analyses performed, and the frequency of sample collection as a function of distance and direction from the Rulison site. It also establishes screening levels or concentrations that, if exceeded in the sample results, require that samples be reanalyzed or additional sampling be done. The natural gas and produced water samples are analyzed for tritium, which is the most mobile contaminant remaining in significant quantities in the detonation zone. Produced water samples are also analyzed for gross alpha and beta radiation and gamma-emitting nuclides to obtain background information. Produced water samples are submitted to a commercial laboratory, which provides analytical services in accordance with the *Department of Defense (DoD) Department of Energy (DOE) Consolidated Quality Systems Manual (QSM) for Environmental Laboratories* (updated annually) to ensure that data are of known, documented quality. These laboratory analytical data are validated according to Section 8.0, "Standard Practice for Validation of Environmental Data," in the *Environmental Procedures Catalog* (LMS/POL/S04325). Table 1 provides the gas and produced water screening activities (concentrations) for tritium, gross alpha and gross beta radiation, and gamma-emitting nuclides (specifically cesium-137). It should be noted that background concentrations for gross alpha and beta have not yet been established.

Table 1. Rulison Area Natural Gas and Produced Water Sample Screening Levels

Analyte	Sample Matrix	Laboratory Detection Limit	Screening Concentration	Action Concentration
Tritium	Natural gas	10 TU[a]	19,293 TU[b]	TBD[d]
	Produced water	400 pCi/L	800 pCi/L	TBD[d]
Gross alpha radiation	Produced water	2 pCi/L	3 × background[c]	TBD[d]
Gross beta radiation	Produced water	4 pCi/L	3 × background[c]	TBD[d]
Cesium-137 (high-resolution gamma spectrometry)	Produced water	10 pCi/L	20 pCi/L	TBD[d]

Notes:
The screening activities (concentrations) were obtained from the *Rulison Monitoring Plan* (DOE 2010).
[a] A tritium unit (TU) is equal to 3.19 picocuries per liter (pCi/L) in water.
[b] The natural gas screening concentration for tritium assumes a standard temperature (0 °C) and pressure (1 atmosphere).
[c] Background concentrations have not been established for gross alpha and beta radiation.
[d] Action concentrations have not been established for the analytes of interest.

Abbreviations:
pCi/L = picocuries per liter
TBD = to be determined
TU = tritium unit (1 tritium atom in 1 × 10^{18} hydrogen atoms)

Sample Collection of Produced Water and Natural Gas

The March 24, 2017, monitoring event included the collection of natural gas and produced water samples from the natural gas wells near the site. A produced water sample could not be collected from well BM 35-32A and samples (natural gas and produced water) could not be collected from wells BM 26-22B and BM 36-13 because these wells were not in production at the time of the monitoring event (Figure 1; Table 2). Samples of the produced water were collected from a tap on the dump line connecting the gas-liquid separators and accumulation tank. Prior to sample collection, the gas-liquid separators that share a dump line were isolated using valves and then purged of produced water and condensate. The samples were contained in 1-gallon plastic containers provided by the laboratory. The produced water samples were submitted to ALS Laboratory Group in Fort Collins, Colorado, for the determination of tritium, gross alpha and beta radiation, and gamma-emitting nuclides.

Samples of the natural gas were collected from a tap on the production line downstream from the gas-liquid separator. Tubing used to connect the tap to the sample bottle was purged prior to sample collection. The natural gas samples were contained in an evacuated 18-liter propane bottle provided by the laboratory. The natural gas samples were submitted to Isotech Laboratories Inc. in Champaign, Illinois, for tritium and carbon-14 analysis. Carbon-14 was included in the natural gas analytical suite to get background levels to use in the future after tritium has decayed to insignificant levels. Carbon-14 is present in the gas phase. It is a longer-lived radionuclide with a half-life of 5700 years. The background data will be useful if gas production in the area continues beyond the next 80 years.

Table 2. Rulison Area Natural Gas Well Sample Locations

Sample Results for Produced Water and Natural Gas

The produced water samples had no detections of tritium or cesium-137 above their respective laboratory minimum detectable concentrations (MDCs). Concentrations of gross alpha and beta radiation were above the MDCs in select samples, but they were consistent with past sample results and within the expected range for background concentrations from naturally occurring radionuclides. Analytical results for produced water and natural gas samples collected on March 24, 2017, are provided in Table 3.

The natural gas samples collected from wells BM 26-33B and BM 26-34C had detections of tritium at an activity (concentration) of 10.4 and 15.5 tritium units (TU), respectively (Table 3). These tritium results are much lower than the screening level (Table 1) established in the *Rulison Monitoring Plan* (DOE 2010) and the *Rulison Sampling and Analysis Plan* prepared by COGCC (COGCC 2017) and do not require any action. The remaining natural gas samples had no detection of tritium above the laboratory MDC. Carbon-14 was also not detected above the laboratory MDCs in any of the natural gas samples. The analytical results were validated in accordance with the Section 8.0, "Standard Practice for Validation of Environmental Data," in the *Environmental Procedures Catalog.* All analyses were completed, and the samples were prepared and analyzed in accordance with accepted procedures for the specified methods. The laboratory radiochemical MDC reported with these data is an a priori estimate of the detection capability of a given analytical procedure, not an absolute concentration that can or cannot be detected. A copy of the Data Validation Package is provided as Appendix A.

Table 3. Analytical Results for Rulison Area Produced Water and Natural Gas Samples from March, 2017

Well Name/Number	API No. 05-045-	Natural Gas[a]		Produced Water			
		Tritium (TU)[b]	Carbon-14 (pMC)[c]	Tritium (pCi/L)	Gross Alpha (pCi/L)	Gross Beta (pCi/L)	Cesium-137 (pCi/L)
BM 26-33B	15743	10.4	<0.5	<350	<56	73.2	<3.9
BM 26-33C	15742	<13.6	<0.5	<360	<53	141	<6.2
BM 26-33D	15739	<11.5	<0.5	<350	<58	144	<4.6
BM 26-34A	15744	<10	<0.5	<340	<62	130	<4.8
BM 26-34B	15745	<13.7	<0.5	<340	<61	96.7	<4.7
BM 26-34C	15741	15.5	<0.5	<350	<65	77.1	<4.6

BM 26-22B	16086	NS	NS	NS	NS	NS	NS
BM 26-34D	15748	<10	<0.5	<330	<57	98.7	<4.9
BM 36-13B[d]	15469	<10	<0.5	<330	<58	168	<4.9
		NA	NA	<350	72.7	182	<5.0
BM 36-13	10840	NS	NS	NS	NS	NS	NS
Screening concentrations		19,293	TBD	800	3 × background[e]	3 × background[e]	20

Notes:
[a] The natural gas samples were initially analyzed by gas chromatography to determine the composition of the natural gas. The samples were then combusted, and the resulting water was collected for tritium and carbon-14 analysis.
[b] A tritium unit (TU), 1 tritium atom in 1×10^{18} hydrogen atoms, is equal to 3.19 pCi/L in water.
[c] pMC is based on the International Radiocarbon Dating Standard, which is 1950 BP.
[d] Indicates that the sample was provided to the laboratory as a field duplicate.
[e] Background activities (concentrations) have not yet been established for gross alpha and beta radiation.

Abbreviations:
API = American Petroleum Institute
BP = before present
NA = not analyzed
NS = not sampled
pCi/L = picocuries per liter
pMC = percent modern carbon
TBD = to be determined
TU = tritium unit (1 tritium atom in 1×10^{18} hydrogen atoms)

Conclusion

The laboratory analytic results obtained from this monitoring event continue to demonstrate that no Rulison detonation-related contaminants have impacted the natural gas wells near the site. This report is available on the LM public website at https://www.lm.doe.gov/rulison/Sites.aspx. Data collected during this and previous monitoring events are available on the Geospatical Environmental Mapping System (GEMS) website at https://gems.lm.doe.gov/#site=RUL.

Sampling Event Summary

Site: Rulison, Colorado, Site

Sampling Period: March 24, 2017

The U.S. Department of Energy Office of Legacy Management conducted sampling at the Rulison, Colorado, Site on March 24, 2017, in accordance with the 2010 *Rulison Monitoring Plan*. See Attachment 1 for the trip report. The Monitoring Plan provides guidance regarding the type and frequency of sample collection as a function of distance and heading from the Rulison detonation point; it also specifies the types of analyses. Natural gas and produced water samples are analyzed for radionuclides to determine if contamination is migrating from the Rulison detonation zone to producing gas wells. Samples were submitted for analysis as follows:

- Natural gas samples were submitted under requisition 17038325 to Isotech Laboratories in Champaign, Illinois, for the determination of carbon-14 and tritium.
- Produced water samples were submitted under requisition 17038324 to ALS Laboratory Group in Fort Collins, Colorado, for the determination of gross alpha/beta, gamma-emitting nuclides, and tritium.

Sampling and analyses were conducted as specified in the *Sampling and Analysis Plan for U.S. Department of Energy Office of Legacy Management Sites* (LMS/PRO/S04351, continually updated). A duplicate sample of produced water was collected at location BM 36-13B (05-045-05-045-15469).

Sample radionuclide results for gamma-emitting nuclides and tritium are compared to the screening levels listed in the Monitoring Plan to determine if any further action is merited. Screening levels have not been determined for gross alpha and gross beta. None of the results for the 11 wells sampled during this event exceeded the screening levels specified in the Monitoring Plan. The natural gas and produced water sample results are presented in Attachment 2.

Water Sampling Field Activities Verification Checklist

Project	Rulison, Colorado	**Date(s) of Water Sampling**	March 24, 2017
Date(s) of Verification	June 1, 2017	**Name of Verifier**	Stephen Donivan

	Response (Yes, No, NA)	Comments
1. Is the SAP the primary document directing field procedures?	Yes	
List any Program Directives or other documents, SOPs, instructions.		Program Directive RUL-2015-01.
2. Were the sampling locations specified in the planning documents sampled?	No	Two gas wells (BM 26-22B and BM 36-13) could not be sampled because the wells were not in production at the time of the sampling event.
3. Were field equipment calibrations conducted as specified in the above-named documents?	NA	Field measurements were not required.
4. Was an operational check of the field equipment conducted daily?	NA	
Did the operational checks meet criteria?		
5. Were the number and types (alkalinity, temperature, specific conductance, pH, turbidity, DO, ORP) of field measurements taken as specified?	NA	
6. Were wells categorized correctly?	NA	This sampling event did not include groundwater.
7. Were the following conditions met when purging a Category I well:		
Was one pump/tubing volume purged prior to sampling?	NA	This sampling event did not include groundwater.
Did the water level stabilize prior to sampling?	NA	
Did pH, specific conductance, and turbidity measurements meet criteria prior to sampling?		
Was the flow rate less than 500 mL/min?	NA	This sampling event did not include groundwater.

Water Sampling Field Activities Verification Checklist (continued)

	Response (Yes, No, NA)	Comments
8. Were the following conditions met when purging a Category II well:		
Was the flow rate less than 500 mL/min?	NA	This sampling event did not include groundwater.
Was one pump/tubing volume removed prior to sampling?		
9. Were duplicates taken at a frequency of one per 20 samples?	Yes	A duplicate sample of produced water was collected at location BM 36-13B (05 045 15469).
10. Were equipment blanks taken at a frequency of one per 20 samples that were collected with non-dedicated equipment?	NA	An equipment blank was not required.
11. Were trip blanks prepared and included with each shipment of VOC samples?	NA	
12. Were the true identities of the QC samples documented?	Yes	
13. Were samples collected in the containers specified?	Yes	
14. Were samples filtered and preserved as specified?	Yes	
15. Were the number and types of samples collected as specified?	Yes	
16. Were chain of custody records completed and was sample custody maintained?	Yes	
17. Was all pertinent information documented on the field data sheets?	Yes	
18. Was the presence or absence of ice in the cooler documented at every sample location?	NA	Sample cooling was not required.
19. Were water levels measured at the locations specified in the planning documents?	NA	

Laboratory Performance Assessment

General Information

Requisition No. (RIN):	17038324
Sample Event:	March 24, 2017
Site(s):	Rulison, Colorado, Site
Laboratory:	ALS Laboratory Group, Fort Collins, Colorado
Work Order No.:	1703527
Analysis:	Radiochemistry
Validator:	Stephen Donivan
Review Date:	June 1, 2017

This validation was performed according "Standard Practice for Validation of Environmental Data" found in Appendix A of the *Sampling and Analysis Plan for U.S. Department of Energy Office of Legacy Management Sites* (LMS/ PRO/S04351, continually updated, https://energy.gov/lm/downloads/sampling-and-analysis-plan-us-department-energy-office-legacy-management-sites). The procedure was applied at Level 3, Data Validation. See attached Data Validation Worksheets (Figures 1–3) for supporting documentation on the data review and validation. All analyses were successfully completed. The samples were prepared and analyzed using accepted procedures based on methods specified by line item code, which are listed in Table 1.

Table 1. Analytes and Methods

Analyte	Line Item Code	Prep Method	Analytical Method
Gamma Spectrometry	GAM-A-001	PA SOP713R11	PA SOP713R11
Gross Alpha/Beta	GPC-A-001	PA SOP702R19	PA SOP724R10
Tritium	LCS-A-001	PA SOP700R10	PA SOP704R9

Data Qualifier Summary

Analytical results were qualified as listed in Table 2. Refer to the sections below for an explanation of the data qualifiers applied.

Table 2. Data Qualifier Summary

Sample Number	Location	Analyte	Flag	Reason
1703527-1	BM 36-13B Duplicate	Gross Alpha	J	Less than the determination limit
1703527-1	BM 36-13B Duplicate	Gross Beta	J	Less than the determination limit
1703527-1	BM 36-13B Duplicate	Lead-212	U	Nuclide identification criteria
1703527-2	BM 26-22C	Gross Beta	J	Less than the determination limit
1703527-3	BM 26-22D	Gross Alpha	J	Less than the determination limit
1703527-3	BM 26-22D	Tritium	J	Matrix spike recovery
1703527-4	BM 26-33B	Actinium-228	U	Nuclide identification criteria

Table 2. Data Qualifier Summary (continued)

Sample Number	Location	Analyte	Flag	Reason
1703527-4	BM 26-33B	Gross Beta	J	Less than the determination limit
1703527-5	BM 26-33C	Gross Beta	J	Less than the determination limit
1703527-6	BM 26-33D	Actinium-228	U	Nuclide identification criteria
1703527-6	BM 26-33D	Gross Beta	J	Less than the determination limit
1703527-7	BM 26-34A	Actinium-228	U	Nuclide identification criteria
1703527-7	BM 26-34A	Gross Beta	J	Less than the determination limit
1703527-8	BM 26-34B	Actinium-228	U	Nuclide identification criteria
1703527-8	BM 26-34B	Americium-241	U	Nuclide identification criteria
1703527-8	BM 26-34B	Gross Beta	J	Less than the determination limit
1703527-9	BM 26-34C	Actinium-228	U	Nuclide identification criteria
1703527-9	BM 26-34C	Gross Beta	J	Less than the determination limit
1703527-10	BM 26-34D	Actinium-228	U	Nuclide identification criteria
1703527-10	BM 26-34D	Gross Beta	J	Less than the determination limit
1703527-11	BM 36-13B	Gross Beta	J	Less than the determination limit
1703527-11	BM 36-13B	Potassium-40	J	Less than the determination limit

Sample Shipping/Receiving

ALS Laboratory Group in Fort Collins, Colorado, received 11 water samples on March 28, 2017, accompanied by a Chain of Custody form. The Chain of Custody form was checked to confirm that all of the samples were listed with sample collection dates and times, and that signatures and dates were present indicating sample relinquishment and receipt. Copies of the shipping labels were included in the receiving documentation. The Chain of Custody form was complete with no errors or omissions.

Preservation and Holding Times

The sample shipment was received intact at ambient temperature which complies with requirements. All samples were received in the correct container types and had been preserved correctly for the requested analyses. Sample analysis was completed within the applicable holding times.

Detection and Quantitation Limits

The method detection limit (MDL) was reported for all metal, organic, and wet chemical analytes as required. The MDL, as defined in 40 CFR 136, is the minimum concentration of an analyte that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The practical quantitation limit (PQL) for these analytes is the lowest concentration that can be reliably measured, and is defined as 5 times the MDL.

For radiochemical analytes (those measured by radiometric counting) the MDL and PQL are not applicable, and these results are evaluated using the minimum detectable concentration (MDC), Decision Level Concentration (DLC), and Determination Limit (DL). The MDC is a measure of radiochemical method performance and was calculated and reported as specified in *Quality*

Systems for Analytical Services. The DLC is the minimum concentration of an analyte that can be measured and reported with 99% confidence that the analyte concentration is greater than zero, and is estimated as 3 times the one-sigma total propagated uncertainty. Results that are greater than the MDC, but less than the DLC are qualified with a "U" flag (not detected). The DL for radiochemical results is the lowest concentration that can be reliably measured, and is defined as 3 times the MDC. Results not previously "U" qualified that are less than the DL are qualified with a "J" flag as estimated values.

The reported MDCs for radiochemical analytes met the detection limits requirements with the following exception. The required detection limits were not met for gross alpha and gross beta samples because of the elevated levels of dissolved solids in the samples.

Laboratory Instrument Calibration

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable qualitative and quantitative data for all analytes. Initial calibration verification demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run. Compliance requirements for continuing calibration checks are established to ensure that the instrument continues to be capable of producing acceptable qualitative and quantitative data. All laboratory instrument calibrations were performed correctly in accordance with the cited methods. All calibration and laboratory spike standards were prepared from independent sources.

Gamma Spectrometry

Activity concentrations above the MDC were reported in some instances where minimum nuclide identification criteria were not met. Such tentative identifications result when the software attempts to calculate net activity concentrations for analytes where either one or both of the following criteria are not satisfied: one or more characteristic peaks for a nuclide must be identified above the critical level, or the minimum library peak abundance must be attained. Sample results for gamma-emitting radionuclides that do not meet the identification criteria are qualified with a "U" flag as not detected.

Method and Calibration Blanks

Method blanks are analyzed to assess any contamination that may have occurred during sample preparation. Calibration blanks are analyzed to assess instrument contamination prior to and during sample analysis. All radiochemical method blank results were below the Decision Level Concentration.

Laboratory Control Sample

Laboratory control samples were analyzed at the correct frequency to provide information on the accuracy of the analytical method and the overall laboratory performance, including sample preparation. All control sample results were acceptable.

Laboratory Replicate Analysis

Laboratory replicate sample results demonstrate acceptable laboratory precision. The relative percent difference value for the chloride matrix spike replicate met the acceptance criteria. The radiochemical relative error ratio (calculated using the one-sigma total propagated uncertainty) for the sample replicates was less than three for all duplicates.

Matrix Spike Analysis

Matrix spike and matrix spike duplicate (MS/MSD) samples are used to measure method performance in the sample matrix. The MS/MSD data are not evaluated when the concentration of the unspiked sample is greater than 4 times the spike concentration. The spike recovery for tritium did not meet the acceptance criteria. The associated sample tritium result is qualified with a "J" flag as an estimated value.

Completeness

Results were reported in the correct units for all analytes requested using contract-required laboratory qualifiers.

Electronic Data Deliverable (EDD) File

The EDD file arrived on May 4, 2017. The Sample Management System EDD validation module was used to verify that the EDD files were complete and in compliance with requirements. The module compares the contents of the file to the requested analyses to ensure all and only the requested data are delivered. The contents of the EDD were manually examined to verify that the sample results accurately reflect the data contained in the sample data package.

General Information

Requisition (RIN):	17038325
Sample Event:	March 24, 2017
Site(s):	Rulison, Colorado, Site
Laboratory:	Isotech Laboratories
Work Order No.:	34413
Analysis:	Radiochemistry
Validator:	Stephen Donivan
Review Date:	June 1, 2017

This validation was performed according to the *Environmental Procedures Catalog*, (LMS/POL/S04325, continually updated) "Standard Practice for Validation of Environmental Data." The procedure was applied at Level 1, Data Deliverables Examination. The data were examined to assess the completeness of the deliverables, identify any reporting errors, and assess the usability of the data based the laboratory's evaluation of their data, as described in the narrative provided. The data are acceptable as received. The samples were prepared and analyzed using accepted procedures based on methods specified by line item code, which are listed in Table 3.

Table 3. Analytes and Methods

Analyte	Line Item Code	Prep Method	Analytical Method
Natural Gas Analysis	LMG-01	NA	Gas Chromatography
Carbon-14 and Tritium	LMG-03	Combustion	Liquid Scintillation Counting

Data Qualifier Summary

None of the analytical results required qualification.

Sample Shipping/Receiving

Isotech Laboratories received 11 natural gas samples on March 28, 2017, accompanied by a Chain of Custody form. The Chain of Custody form was checked to confirm that all of the samples were listed with sample collection dates and times, and that signatures and dates were present indicating sample relinquishment and receipt. Copies of the shipping labels were included in the receiving documentation. The Chain of Custody form was complete with no errors or omissions.

Summary

Eleven natural gas samples were received at Isotech Laboratories and analyzed by gas chromatography to determine the natural gas composition. The samples were then combusted with the resulting water collected for analysis. Carbon-14 and tritium were measured in the water collected by liquid scintillation counting. There were no analytical difficulties noted by the laboratory.

Completeness

The results of the gas chromatography analyses were reported in volume percent showing the average sample composition of 90% methane.

The carbon-14 results were reported in percent modern carbon (pMC). The tritium results were reported in tritium units. Carbon-14 was not detected in any of the samples. Tritium was detected in samples BM 26-33B and BM 26-34C.

Sampling Quality Control Assessment

The following information summarizes and assesses quality control for this sampling event.

Sampling Protocol

The produced-water samples were collected from a tap on a common line connecting the output of two separators (each servicing a well) and the nearby accumulation tanks. The collected water sample from one separator was isolated from the other separator by valves. Lines from each of the two separators were purged before sample collection.

Natural gas samples were collected as specified in Program Directive RUL-2015-01 in an evacuated 17.8-liter gas cylinder provided by Isotech Laboratories, Inc. Each sampling container was filled to approximately 25 pounds per square inch with natural gas from each well.

Equipment Blank Assessment

Equipment blanks are prepared and analyzed to document contamination attributable to the sample collection process. An equipment blank was not required.

Field Duplicate Assessment

Field duplicate samples are collected and analyzed as an indication of overall precision of the measurement process. The precision observed includes both field and laboratory precision and has more variability than laboratory duplicates, which measure only laboratory performance. A duplicate sample was collected from location BM 36-13B. For radiochemical measurements, the relative error ratio (the ratio of the absolute difference between the sample and duplicate results and the sum of the 1-sigma uncertainties) is used to evaluate duplicate results and should be less than 3. All duplicate results met this criteria demonstrating acceptable precision (Figure 4).

Certification

All laboratory analytical quality control criteria were met except as qualified in this report. The data qualifiers listed on the environmental database reports are defined on the last page of each report. All data in this package are considered validated and available for use.

Re: Trip Report – 1st Semiannual Gas Well Sampling Event 2017

Site: Rulison, Colorado, Site

Date of Event: March 24, 2017

Team Members: Jeff Price, David Atkinson, and Rick Findlay all from Navarro.

Number of Locations Sampled: Samples (produced water and natural gas) were collected from 11 of the 13 planned sample locations.

Locations Not Sampled/Reason: Two gas wells (BM 26-22B and BM 36-13) could not be sampled because the wells were not in production at the time of the sampling event.

Quality Control Sample Cross Reference: Table 1 provides the false identification assigned to the quality control sample.

Table 1. Quality Control Sample Summary

False ID	Ticket Number	True ID	Sample Type	Associated Matrix
2657	PEQ 676	BM 36-13B	Duplicate	Produced Water

Requisition Index Number (RIN) Assigned: Samples were assigned to RINs 17038324 and 17038325. Field data sheets can be found at \\crow\sms\17038324\FieldData.

Sample Shipment: The samples (produced water and natural gas) were shipped via FedEx from Grand Junction, Colorado, on March 27, 2017. The produced water samples were sent to ALS Laboratory Group in Fort Collins, CO, and the natural gas samples were shipped to Isotech Laboratories in Champaign, Illinois.

Well Inspection Summary: No issues were identified.

Sampling Method: Samples were collected according to the *Sampling and Analysis Plan (SAP) for the U. S. Department of Energy Office of Legacy Management Sites* (LMS/PRO/S04351, continually updated) and Program Directive RUL-2015-01.

Field Variance: None.

Equipment: All equipment functioned properly.

Stakeholder/Regulatory/DOE: Jonathan Damiano (DOE Quality Assurance Manager) was onsite to observe the sampling activities. Keith Rice with Caerus Oil and Gas provided access to the natural gas wells.

Safety Issues: None.

Access Issues: None.

General Information: Nothing to note.

Immediate Actions Taken: None.

Future Actions Required or Suggested: None.

SAMPLE ID CODES: 000X = Filtered sample (0.45 µm). N00X = Unfiltered sample. X = replicate number.

LAB QUALIFIERS:
- * Replicate analysis not within control limits.
- > Result above upper detection limit.
- A TIC is a suspected aldol-condensation product.
- B Inorganic: Result is between the IDL and CRDL. Organic: Analyte also found in method blank.
- C Pesticide result confirmed by GC-MS.
- D Analyte determined in diluted sample.
- E Inorganic: Estimate value because of interference, see case narrative. Organic: Analyte exceeded calibration range of the GC-MS.
- H Holding time expired, value suspect.
- I Increased detection limit due to required dilution.
- J Estimated
- N Inorganic or radiochemical: Spike sample recovery not within control limits. Organic: Tentatively identified compound (TIC).
- P > 25% difference in detected pesticide or Aroclor concentrations between 2 columns.
- U Analytical result below detection limit.
- W Post-digestion spike outside control limits while sample absorbance < 50% of analytical spike absorbance.
- X,Y,Z Laboratory defined qualifier, see case narrative.

DATA QUALIFIERS:
- F Low flow sampling method used.
- G Possible grout contamination, pH > 9.
- J Estimated value.
- L Less than 3 bore volumes purged prior to sampling.
- Q Qualitative result due to sampling technique.
- R Unusable result.
- U Parameter analyzed for but was not detected.
- X Location is undefined.

QA QUALIFIER:
- # Validated according to quality assurance guidelines.
