Subject: Radiological Survey of Three Buildings, report of

1. Radiation levels were measured in buildings 21, 23, and 24 at above site on January 9 and 10th of 1964. Alpha levels were determined using an Eberline PAC-3 G with a 62 cm<sup>2</sup> surface area probe. Beta-gamma measurements were made with a Tracerlab S U -1 H ionization chamber having a 1 mg/cm<sup>2</sup> window.

## I. Report of Building Measurements

disintegration  
Alpha disintegration rate is given as total alphas with respect to geometry. Therefore, the 5.4 alphas per disintegration of thorium-232 is summed in the units of dpm per 100 cm<sup>2</sup>.

1. Measurements for building 21 have already been submitted. Results will be summarized in discussion.

2. Measurements for building 23

II Report of Dry Smears Taken

Seventeen Smears were taken with Whatman 41 filter paper. The area of wipe sample was 100cm<sup>2</sup>. Correction has been made to give disintegration rate of thorium-232.

III Discussion of Survey

1. Building 21

- a. Areas having a beta-gamma dose higher than 2.0 mr/hr must be classified and posted as restricted areas and higher than 5.0 mr/hr as radiation areas. Reference floor plans and Federal Register, Title 10 Part 20.

b.

A bottle of thorium was in cabinet at position 142. If the amount is in excess of 0.5 mc or 10 lb. the container must be labeled in manner specified in 10 CFR Part 20.

*not given  
sample  
in 2/2/60*

### III Discussion of Survey (continued)

- 3000 c. Wall surfaces have an average alpha disintegration rate of  $3 \times 10^3$  alphas/min./100cm<sup>2</sup>. Compartments within the building do show gradients above and below this figure. Considering smear survey, particles of brick were on filter paper, it appears thorium has penetrated brick surfaces. Whether decontamination can be accomplished and to what degree on these surfaces is a moot point. Thorium may have permeated beyond the surface layer that is detectable. Gamma dose rates reinforce this idea. Floors for the most part are dirt. There is evidence monizite is mixed with the dirt. Some areas, high gamma dose, indicate large amounts of monizite is present. Concrete floors more the most part are lower than wall surfaces. Smears reveal very little activity on the concrete surfaces.

#### 2. Building 23

- 800 N a. Wall surfaces average  $8 \times 10^2$  alphas/min./100cm<sup>2</sup> with  
10,000 max maximum areas of  $10^4$  alphas/min./100cm<sup>2</sup>. The floor is  
totally earthen and averages  $10^4$  alphas/min./100cm<sup>2</sup>.  
1000 Wooden flooring on the second floor appears to have  
fixed activity of  $10^3$  alphas/min./cm<sup>2</sup>. No restricted  
areas exist.

#### 3. Building 24

- a. Sheet metal surfaces are noted as walls and sills denote  
the wooden 4 x 4's in the horizontal position. Top  
surfaces of sills were approximately a factor of 10 higher  
than bottom surfaces. Coupled with information from smears  
and information concerning decontamination of this building,  
it is unlikely penetration of thorium dust is very deep in  
the wood. Average dose rate from wooden sills and floor  
10,000 is  $10^4$  alphas/min./100cm<sup>2</sup>. All interior surfaces are quite  
uniform with respect to dose rates.

4. A scrape pile between buildings 21 and 24 contains radioactivity.

### IV Impression

1. Four areas in building 21 must be posted in accordance with State and Federal Regulations.
2. The total amount of thorium present is not large and is for the most part semi-fixed. The exceptions being concentrations of monizite in the ground of building 21.
3. It is very unlikely regulatory bodies would permit these building to be used at present levels of activity. Either extensive decontamination and/or razing of buildings must be done unless management wishes to have the buildings remain empty. Acceptable levels should be established with regulatory agencies before discussions concerning further disposition of the buildings made.

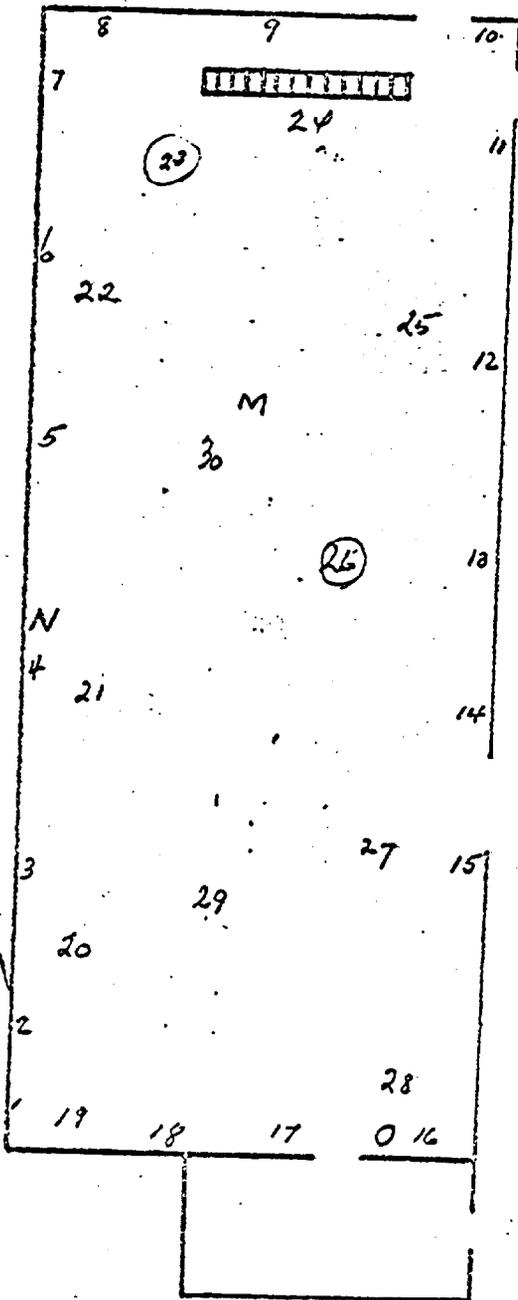

## V. Disposal of Contaminated Materials

1. 10 CFR, Part 20 regulates the amounts of radioactive materials that may be released to the <sup>environment</sup> without prior A.E.C. approval. The New Jersey State Commission has extracted and set the same standards.
2. Possible methods of disposal are burial on site, burial at local dump sites, disposal at sea and incineration. The amounts of activity and economics involved will dictate the method or methods to be used.
