Re: Demolition of Rooms 220/320, B774	
Purpose of Contact: As part of the consultative process, the demolition of Rooms 220 and 320 of Building 774 was discussed with Colorado Department of Public Health and Environment (CDPHE). The exterior of the south wall of Room 220 is common to the underground radioactive waste storage tanks that were remediated in October for this year. Because hydrolazing this wall could introduce additional radioactive contamination into the surrounding soil, Room 220 will be demolished and dispositioned as radioactive waste. Room 320, which is located directly above Room 220 and FR-203 (located in Room 320) will be also demolished and dispositioned as radioactive waste.

Purpose of Contact: Removal of Sanitary Sewer West of Building 371. A portion of the Sanitary Sewer line that connected Building 116 to the 371 Trailers will be removed because the dirt in this area will be used as backfill at other site locations, and it is anticipated that the sewer line will no longer be 3 feet or more below grade. The associated manholes and cleanouts will be removed at the same time to ensure that all remaining structures are greater than 3 feet below grade at final grade.

Discuss plans for Room 3813 Drain Pip removal	
Purpose of Contact: Two process drain trenches located in Building 374, Room 3813 currently are lined with a stainless steel covering and are located in the floor of Room 3813. One trench is longer (approximately 8 feet) and contains no process drain piping. The second trench is smaller (approximately 2 feet) and contains a process drain vent and pipe leading to concrete foundation and continuing through the concrete slab to Room 2804 tank farm. Since these trenches were originally lined with stainless steel, no surveys will be conducted below the stainless steel.

Discuss GB 118, Room 3803, B374 Remaining Structure	
<p>Purpose of Contact: Building 374, Room 3803, contained 118 that ran from the floor of Room 3803, through the ceiling, and into the mezzanine level Room 4805. A partial area of the ceiling of Room 3803 and floor of Room 4805 was part of the Glovebox structure. This Glovebox has been removed during stripout of these rooms. As such, there is a large area of the ceiling/floor that remains contaminated. In addition, this area includes structural beams and smaller pieces of glovebox metal that were welded to these beams. The removal of these structural beams prior to demolition would be extremely cumbersome and would possibly create instability in the floor loading of these areas. Kaiser-Hill Company, L.L.C. (K-H) will leave the area of the ceiling /floor inside the perimeter of the removed glovebox as contaminated and remove this portion during demolition as low-level waste. All contamination will be fixed.</p>

The purpose of this report is to communicate and document the results of Building 374, Room 3813 Dock Area and exterior surfaces of Building 374. PDS is performed prior to building demolition to define the pre-demolition radiological and chemical conditions of a facility. The pre- demolition conditions are compared with the release limits for radiological and non-radiological contaminants. PDS results will enable project personnel to make final disposition decisions, develop related worker health and safety controls, and estimate waste volumes by waste types.
